## Executive Summary

The acid generation and metal release potential of waste rock and tailings to be produced by Tintina Montana's Black Butte Copper Project have been characterized using static multi-element analysis, acid-base accounting, net acid generation potential, and kinetic methods. Mineralogical analyses of metal residence and asbestiform mineral analyses were also completed. Results of all static and kinetic tests of waste rock and tailings materials are reported.

A total of 778,810 tons (706,525 tonnes) of waste rock that consist predominantly of the Lower-Zone Footwall (*LZ FW*, 35% of waste rock tonnage), the Lower Newland basal shale and conglomerate (*Ynl B*, 32%), the Upper Sulfide Zone (*USZ*, 28%), and the Undifferentiated Lower Newland (*Ynl A*, 4%) will be produced from the underground mine during the life of the mine. This rock will be exposed in underground access workings and, temporarily, in active stopes. It will also be stockpiled for up to 2 years on a lined surface pad prior to being co-disposed with cemented tailings in a doubly lined facility early in mine life. Additional waste lithotypes representing tonnages less than 1% (including *IG*, *Ynl 0*, *Yne*, and *Yc*) have also been characterized. Additionally, geochemical characterization of shallow weather near-surface bedrock deposits is reported separately (Enviromin, 2017b).

Tintina proposes to produce tailings via flotation and to blend them with equal amounts of cement and slag binder (1% each in 2% amendment; 2% each in 4% amendment) to create cemented paste tailings. Using a drift and fill mining method, Tintina proposes to place 45% of produced tailings as 4% cemented backfill into mined out underground workings during operations. All remaining tailings (approximately 55%) will be placed as 0.5 to 2% cemented paste into a double lined surface tailings impoundment called the cemented tailings facility (CTF). The CTF is designed to have little or no water stored in the facility. Most waste rock will be produced during construction of the decline and other underground workings and will be placed into the lowermost portion of the CTF, where it will subsequently be covered by paste tailings. Run-of-mine (ROM) waste rock will also be placed around the sump to develop a positive drain within the CTF, and will be encapsulated with paste tailings. It is possible that alternative management strategies including dry stack tailings and a subaqueous tailing impoundment will be considered during the MEPA assessment. This environmental geochemical testing program has addressed all proposed management options and anticipated alternatives. Raw (non-amended) tailings were, therefore, tested along with cemented paste tailings with 2 and 4% cement binders, and 4% cement binder mixed with 10% ROM to simulate alternative disposal methods. Tailings were tested under both subaerial weathering and saturated conditions.

Although metal concentrations measured in kinetic tests exceeded one or more surface water standards in several tests, discharge to surface water is unlikely because mine-affected water will be collected during operations and treated prior to discharge to groundwater. Therefore, this analysis focuses on compliance with groundwater standards (MT DEQ, 2012), with the exception of the analysis of saturated humidity cell test of raw tailings, which represents surface water in a subaqueous tailing facility pond.

**Waste Rock Geochemistry.** A total of 7,497 whole rock samples of waste rock, including 5,642 of the four dominant waste rock units, were statistically analyzed to characterize overall geochemical variability within multiple lithotypes and to identify representative sample subsets for static testing. No asbestiform minerals were identified

in any lithotype to be mined from the Project. Some 175 static tests of acid generation potential, using both acid-base accounting (ABA) and net acid generation (NAG) methods, indicate that the majority of *Ynl B* and *Ynl A* samples (90%) are unlikely to form acid, while many *USZ* and some *LZ FW* samples have an uncertain potential or are likely to generate acid. The acid generation potential of these representative samples of waste rock is consistent with the known site geology, which includes local sulfide stringers within highly neutralizing carbonate bedrock.

Eight kinetic humidity cell tests (HCTs) of representative composites of waste rock were conducted for the Project. These HCTs uniformly show that while sulfide oxidation was observed for the four dominant waste rock units, resulting in the release of sulfate and some metals, the pH remained circum-neutral, with the exception of a decrease in the 2015 *USZ* after 60 weeks of testing. Consistent with static test results and the presence of abundant carbonate mineralization, oxidation in the *Ynl B*, *Ynl A*, and *LZ FW* tests did not produce sufficient acidity to deplete alkalinity nor did these tests produce acidic pH values. Despite indications of varying degrees of sulfide oxidation in all tests, depleted alkalinity and increased acidity with variable pH was observed solely in the 2015 *USZ* test.

All assessments of metal release potential for waste rock lithotypes (tonnage >1%) have been based on metal concentrations measured in kinetic test effluents in weeks 0, 1, 2, 4, and every 4 weeks thereafter. Consistent with the observed neutral pH in the test cells, the *Ynl B* and *Ynl A* units showed minimal potential to release metal, particularly Tl, after week 2. The *LZ FW* and *USZ* units, however, have shown variable potential for release of several metals including As, Sb, Be, Cd, Cu, Hg, Ni, Pb, Sr, Tl, and U in concentrations that exceed relevant groundwater standards. Because each of the dominant waste rock lithotypes has some, if not significant, potential to release concentrations of metals in excess of water quality standards, waste rock will be encapsulated in paste tailings in the lined and monitored CTF impoundment. Furthermore, Tintina proposes to treat all seepage from the temporary waste rock stockpile, the CTF, and the underground workings during operations to meet non-degradation standards for groundwater prior to discharge. At the end of operations, Tintina proposes to simultaneously flood and pump groundwater for treatment in order to rinse residual oxidation products from exposed surfaces in underground workings. Predictive models of water quality in the underground workings during operations and post-closure, as well as from the temporary waste rock stockpile, the CTF sump, and the process water pond are presented in a separate report (Enviromin, 2017c).

**Tailings Geochemistry.** Splits of homogenized tailings reject produced in bench-scale metallurgical testing were used for all tests. Treatments of tailings evaluated in the geochemical test program include non-amended tailings, paste tailings made with 2% binders, paste tailings made with 4% binders, and paste tailings (4% binders) mixed with run-of-mine waste rock. Cement added to provide structural strength in backfill, and create a stable, non-flowable material with low hydraulic conductivity, on the order of  $10^{-8}$  cm/sec, does not add sufficient neutralization potential to neutralize acidity in the tailings. ABA and NAG tests thus indicate that the tailings will have a strong potential to generate acid with or without paste amendment.

Cemented paste tailings cylinders were tested (without crushing) in conventional ASTM method D5744 humidity test cells, to simulate sub-aerial weathering, and in ASTM C1308 diffusion tests, to simulate diffusion of oxygen through backfill in saturated underground workings. Raw (non-amended) tailings were tested using ASTM method D5744, both sub-aerially and in a modified, saturated ASTM method D5744 test, to

represent the alternative scenarios of dry stack surface placement and subaqueous deposition impoundment, respectively.

The diffusion test of the 4% paste tailings maintained a variable, but overall higher, pH between 6.6 and 9.7, with available alkalinity and less sulfate throughout the test than the 4% with ROM cylinder, in which pH ranged from 5.5 to 6.8. This suggests that the massive cemented paste tailings, where the matrix is not interrupted by rock fragments, is important in controlling sulfide exposure for oxidation. Rates of metal release were significantly lower in diffusion tests of saturated cement paste tailings than in unsaturated humidity cell tests of cemented paste tailings. In fact, groundwater standards were only exceeded for As and Tl in the 4% binder and 4% with ROM cylinders, respectively. Furthermore, because the backfilled paste tailings have very low transmissivity they will react slowly with groundwater and are unlikely to create acidity or release concentrations of metals above groundwater standards. The influence of this low reactivity on water quality in the underground workings is modeled and reported separately (Enviromin, 2017c).

Conventional, aerated HCTs of paste tailings were used to evaluate behavior of the paste tailings in surface deposits within the CTF. Acid and sulfate production as well as pH and metal release varied between the cemented paste treatments, largely as a result of differences in disaggregation rates which change reactive surface area. Generally, cemented paste cylinders with higher binder contents crumbled less and therefore released sulfate, acidity, and metals more slowly. Specifically, the 2% HCT test exhibited greater and earlier sulfate and acid release than the 4% tests. The HCTs of cylinders conservatively represent the potential rates of oxidation for cemented paste tailings, because tests were run on small cylinders with a higher surface area to mass ratio than would exist within the more massive lifts of cemented paste in the CTF. Therefore, declining water quality observed in later weeks of testing is unlikely to represent the field conditions in the CTF.

Although the initial rates of metal release for cemented paste tailings was lower than for raw tailings for most metals, the rates of metal release from the 2% cement paste HCT approached that of the unsaturated raw tailings HCT after 4 weeks. Metal concentrations in effluent from the 4% paste cement backfill HCT were lowest of the paste tailings HCTs, and exhibited isolated groundwater exceedances for As, Be, Cr, Cu, Ni and Tl, primarily in the later weeks of testing, when physical breakdown began to influence results. Similarly, the 4% with ROM HCT exceeded the groundwater quality standard for Tl in early weeks of testing, with exceedances of Sb, As, Be, Cd, Cr, Cu and Ni, observed primarily in later weeks. The data from the 4% HCT are used in geochemical models of underground at year 6 and the CTF, and are presented elsewhere (Enviromin, 2017c).

The raw “non-amended” tailings sample tested in the conventional, subaerial kinetic test became strongly acidic and showed a correspondingly high potential to generate sulfate and several metals at low pH throughout the test. In contrast, a much lower oxidation rate was observed in the saturated kinetic HCT of non-amended tailings, which is intended to represent tailings deposited in a subaqueous impoundment pond. Few metals exceeded relevant groundwater and surface water quality standards in HCT effluent and were generally detected at much lower concentrations until week 35 of testing, when alkalinity was depleted, pH dropped, and metal concentrations rose.

**Conclusions.** The four dominant waste rock units showed evidence of sulfide oxidation in the HCTs but only the 2015 USZ produced significant acidity or low pH. The *Ynl B* and

*Ynl A* units maintained neutral pH in the test cells and did not exceed groundwater standards after week 2. The *LZ FW* also maintained a neutral pH, but exceeded certain groundwater standards for select metals. Despite consistent sulfate production, the pH in the 2015 *USZ*, did not trend downward until week 60, at which time alkalinity was depleted and sulfate and metal release increased. Release of several metals in excess of groundwater standards was observed in the 2015 *USZ* HCT. Due to the potential for release of various metals at different times in the predicted weathering process, Tintina proposes to encapsulate all waste rock in paste tailings within the double-lined CTF impoundment. Furthermore, Tintina proposes to collect all seepage from the waste rock stockpile, the CTF, and the underground workings for treatment prior to discharge via underground infiltration galleries. With implementation of these engineering controls, potential for negative impacts to surface and groundwater is low.

Results of the diffusion kinetic tests indicate that saturated 4% cemented paste tailing in backfill is unlikely to become acid, although it has potential to release As in concentrations above groundwater standards. Results of HCTs indicate that all of the cemented paste amended tailings treatments have potential to oxidize when weathered subaerially (after a lag time) and to release at least some sulfate, acidity, and metals if left exposed to air and water. Importantly, the rate of oxidation is proportional to cement paste amendment of tailings in the small test cylinders. In the CTF, each new lift of cemented paste tailings will behave as a massive block of material with low transmissivity, with a thin upper surface that will be exposed to some degree of oxidation before being covered by fresh paste tails within days of placement. If material is covered in a timely manner (on the scale of weeks), relatively little oxidation, acidity, and leaching of metals is expected to occur and would be limited to the immediate surface of the cemented paste tailings. Any water interacting with oxidized tailings will react with dominantly net neutralizing waste rock in the bedding layer before being collected in a sump in the lined facility for treatment and discharge. No water will be stored in the CTF.

At closure, the paste tailings deposit will be covered with a final lift of 4% cemented paste tailings and a geotextile membrane will eliminate long-term exposure of the final lifts to oxygen and water. The double-lined CTF with drainage collection is designed to prevent discharge to surface water and groundwater. Subaqueous placement of tailings appears to be most effective at limiting sulfide oxidation, followed by placement of 4% cement amended tailings in saturated underground workings. However, if a subaqueous impoundment alternative were to be considered, some release of metals to the tailings pond would be expected to occur in concentrations that exceed surface water standards, and possibly groundwater standards over prolonged periods, if the pH drops as a result of alkalinity depletion. Significant acid rock drainage should be expected to develop in subaerially weathered, fine-grained “raw” tailings, suggesting that a “dry stack” alternative management scenario may not be effective.

## 1 Introduction

Tintina Montana Inc. (Tintina) has submitted a Mine Operating Permit (MOP) Application for its Black Butte Copper Project, located approximately 15 miles (24 km) north of the town of White Sulphur Springs, Montana (**Figures 1-1** and **1-2**). In support of the proposed underground mining operation, Enviromin, Inc. has conducted extensive environmental geochemical testing from 2011 to the present. As defined in the MOP Application, Tintina plans to advance underground mining operations through the proposed 2012 Johnny Lee Underground Decline (2012 Decline) into the Upper Copper Zone (UCZ) and deeper into the Lower Copper Zone (LCZ) (**Figure 1-3**).

In order to produce an operational plan that complies with Montana Department of Environmental Quality (MT DEQ) regulations, Tintina has conducted a thorough baseline characterization of acid generation and trace element release potential for waste rock and tailings materials. These data are useful for design of mined rock storage facilities and represent a summary of geochemical baseline conditions for the mining operation. The 2012 Decline proposal was never implemented by Tintina or approved by the MT DEQ, but is included in a modified plan (defined below) in the current MOP Application.

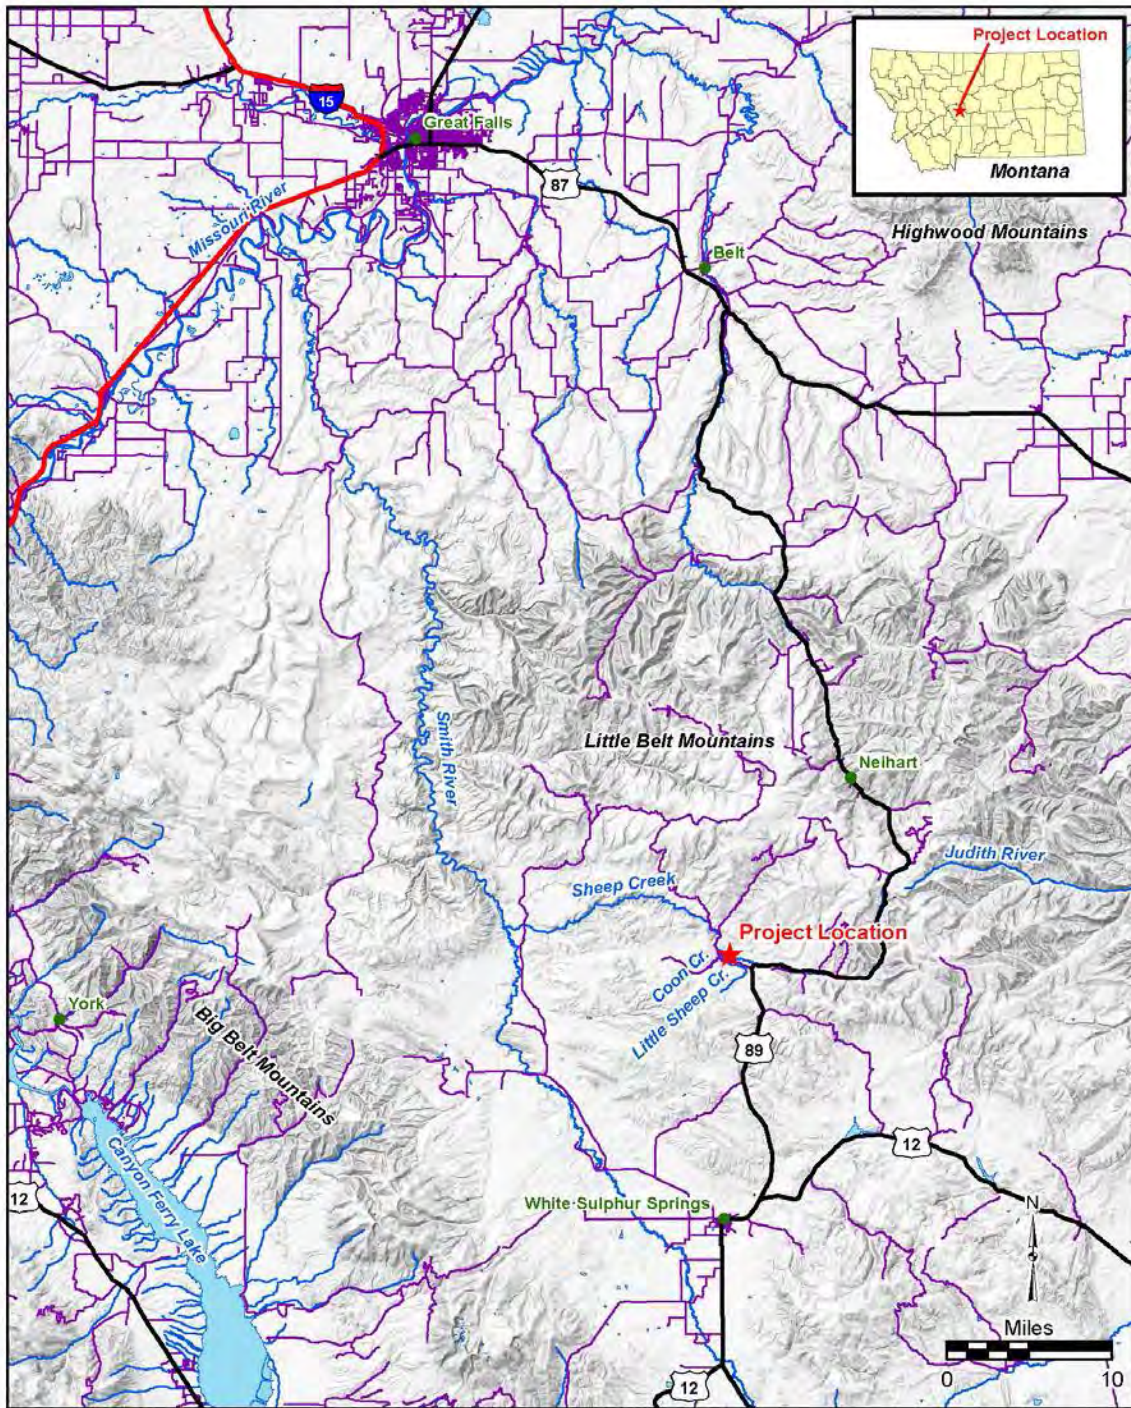

### 1.1 Project History

Mineral exploration in the vicinity of the Black Butte Copper Project has been ongoing for more than 30 years. As a result, there is a substantial amount of exploration geochemistry data available (Tintina, unpublished data; Resource Modeling, Inc., 2012). These historical efforts focused primarily on assay and multi-element geochemical analyses for exploration purposes, with limited collection of environmental geochemistry data. More recent efforts to characterize acid generation and trace element release potential of mined materials utilized the multi-element exploration data to guide sample selection for environmental geochemical testing.

In 2011, an environmental geochemical testing program was initiated to support development of the proposed 2012 Decline, which will be used to access mine workings under the currently proposed plan. The length of the decline is approximately 5,200 ft (a horizontal distance of 5,000 ft). It will be collared in the Undifferentiated Lower Newland (*Ynl A*, this lithotype has also been referred to as “*Ynl*” and appears with that label in laboratory results) just above the Dolomite (*Ynl 0*), and driven through a section of interbedded *Ynl A* and *Ynl 0* until it intercepts the *0/1 Sulfide Zone* horizon just above the Upper Sulfide Zone (*USZ*). The 2012 Decline is also expected to intercept the *Ynl B* footwall unit at depth. The initial baseline geochemical testing program therefore included static and kinetic testing of the lithotypes that comprised significant tonnage (defined as more than 1%) to be produced by the 2012 Decline as it was initially proposed. These lithotypes included: igneous dikes (*IG*), *Ynl A*, *Ynl 0*, Lower Newland shale and conglomerate (*Ynl B*), and the Upper Sulfide Zone (*USZ*).

In late 2014, Tintina shifted focus from the 2012 Decline project to a more comprehensive mine operational-scale plan (decline excavation) covering the entire copper deposit, which expanded on the proposed 2012 Decline by extending the underground workings through the *USZ* and into the previously uncharacterized Lower Copper Zone (*LCZ*). The total quantity of waste rock associated with the life of mine is 778,810 tons (706,525 tonnes). As a result, this environmental geochemical testing program has been updated to include additional, previously uncharacterized lithotypes and to address any geochemical variation throughout the proposed mine as defined in the current MOP Application, in addition to the immediate vicinity of the 2012 decline.

During geochemical testing of the expected waste rock tonnages changed in response to the comprehensive mine plan. Therefore, of the 7, 497 available exploration samples of waste-grade rock, only 5,642 remain relevant to the operational plans defined in the current MOP Application. For completeness, geochemical data for all previously-investigated rock types are included in this report (**Table 1-1**), but the discussion and analyses focus specifically on lithotypes occurring with greater than 1% (by tons) frequency for the entire life of mine underground mine plan. This plan is associated with 778,810 tons (706,525 tonnes), and associated with rocks from the following units: the Lower Zone Footwall (LZ FW), Ynl B, USZ, and Ynl A. Additionally, this report addresses geochemical characterization for tailings under various proposed management scenarios. Geochemical testing of near-surface construction materials is reported separately (Enviromin, 2017b).

## **1.2 Operational Plan and Data Application**

The design of the Black Butte Copper Project has been directly informed by the environmental geochemical data presented here. Mine facilities potentially influenced by geochemistry include the temporary waste rock storage (WRS) pad, contact water pond (CWP), water treatment facility, underground infiltration galleries (UIGs) process water pond (PWP), cemented tailings facility (CTF), and subsurface underground (UG) workings. These facilities (**Figure 1-2**) are described in detail in Tintina's MOP Application and summarized below.

In recognition of the high total sulfide mineral content of the tailings to be produced from the Black Butte Copper deposit, Tintina has proposed an innovative, cemented paste tailings storage design. By incorporating equal amounts of cement and binder (slag) into the thickened tailings material as they are placed in the double-lined and monitored CTF, Tintina will encapsulate the sulfidic materials and limit their exposure to oxygen and water, as well as reduce the potential for material transport in the event of dam failure. Further, following temporary storage of waste rock on a lined pad, Tintina proposes to encapsulate all mined waste rock within the CTF, thereby limiting acid and metal release potential from the waste rock.

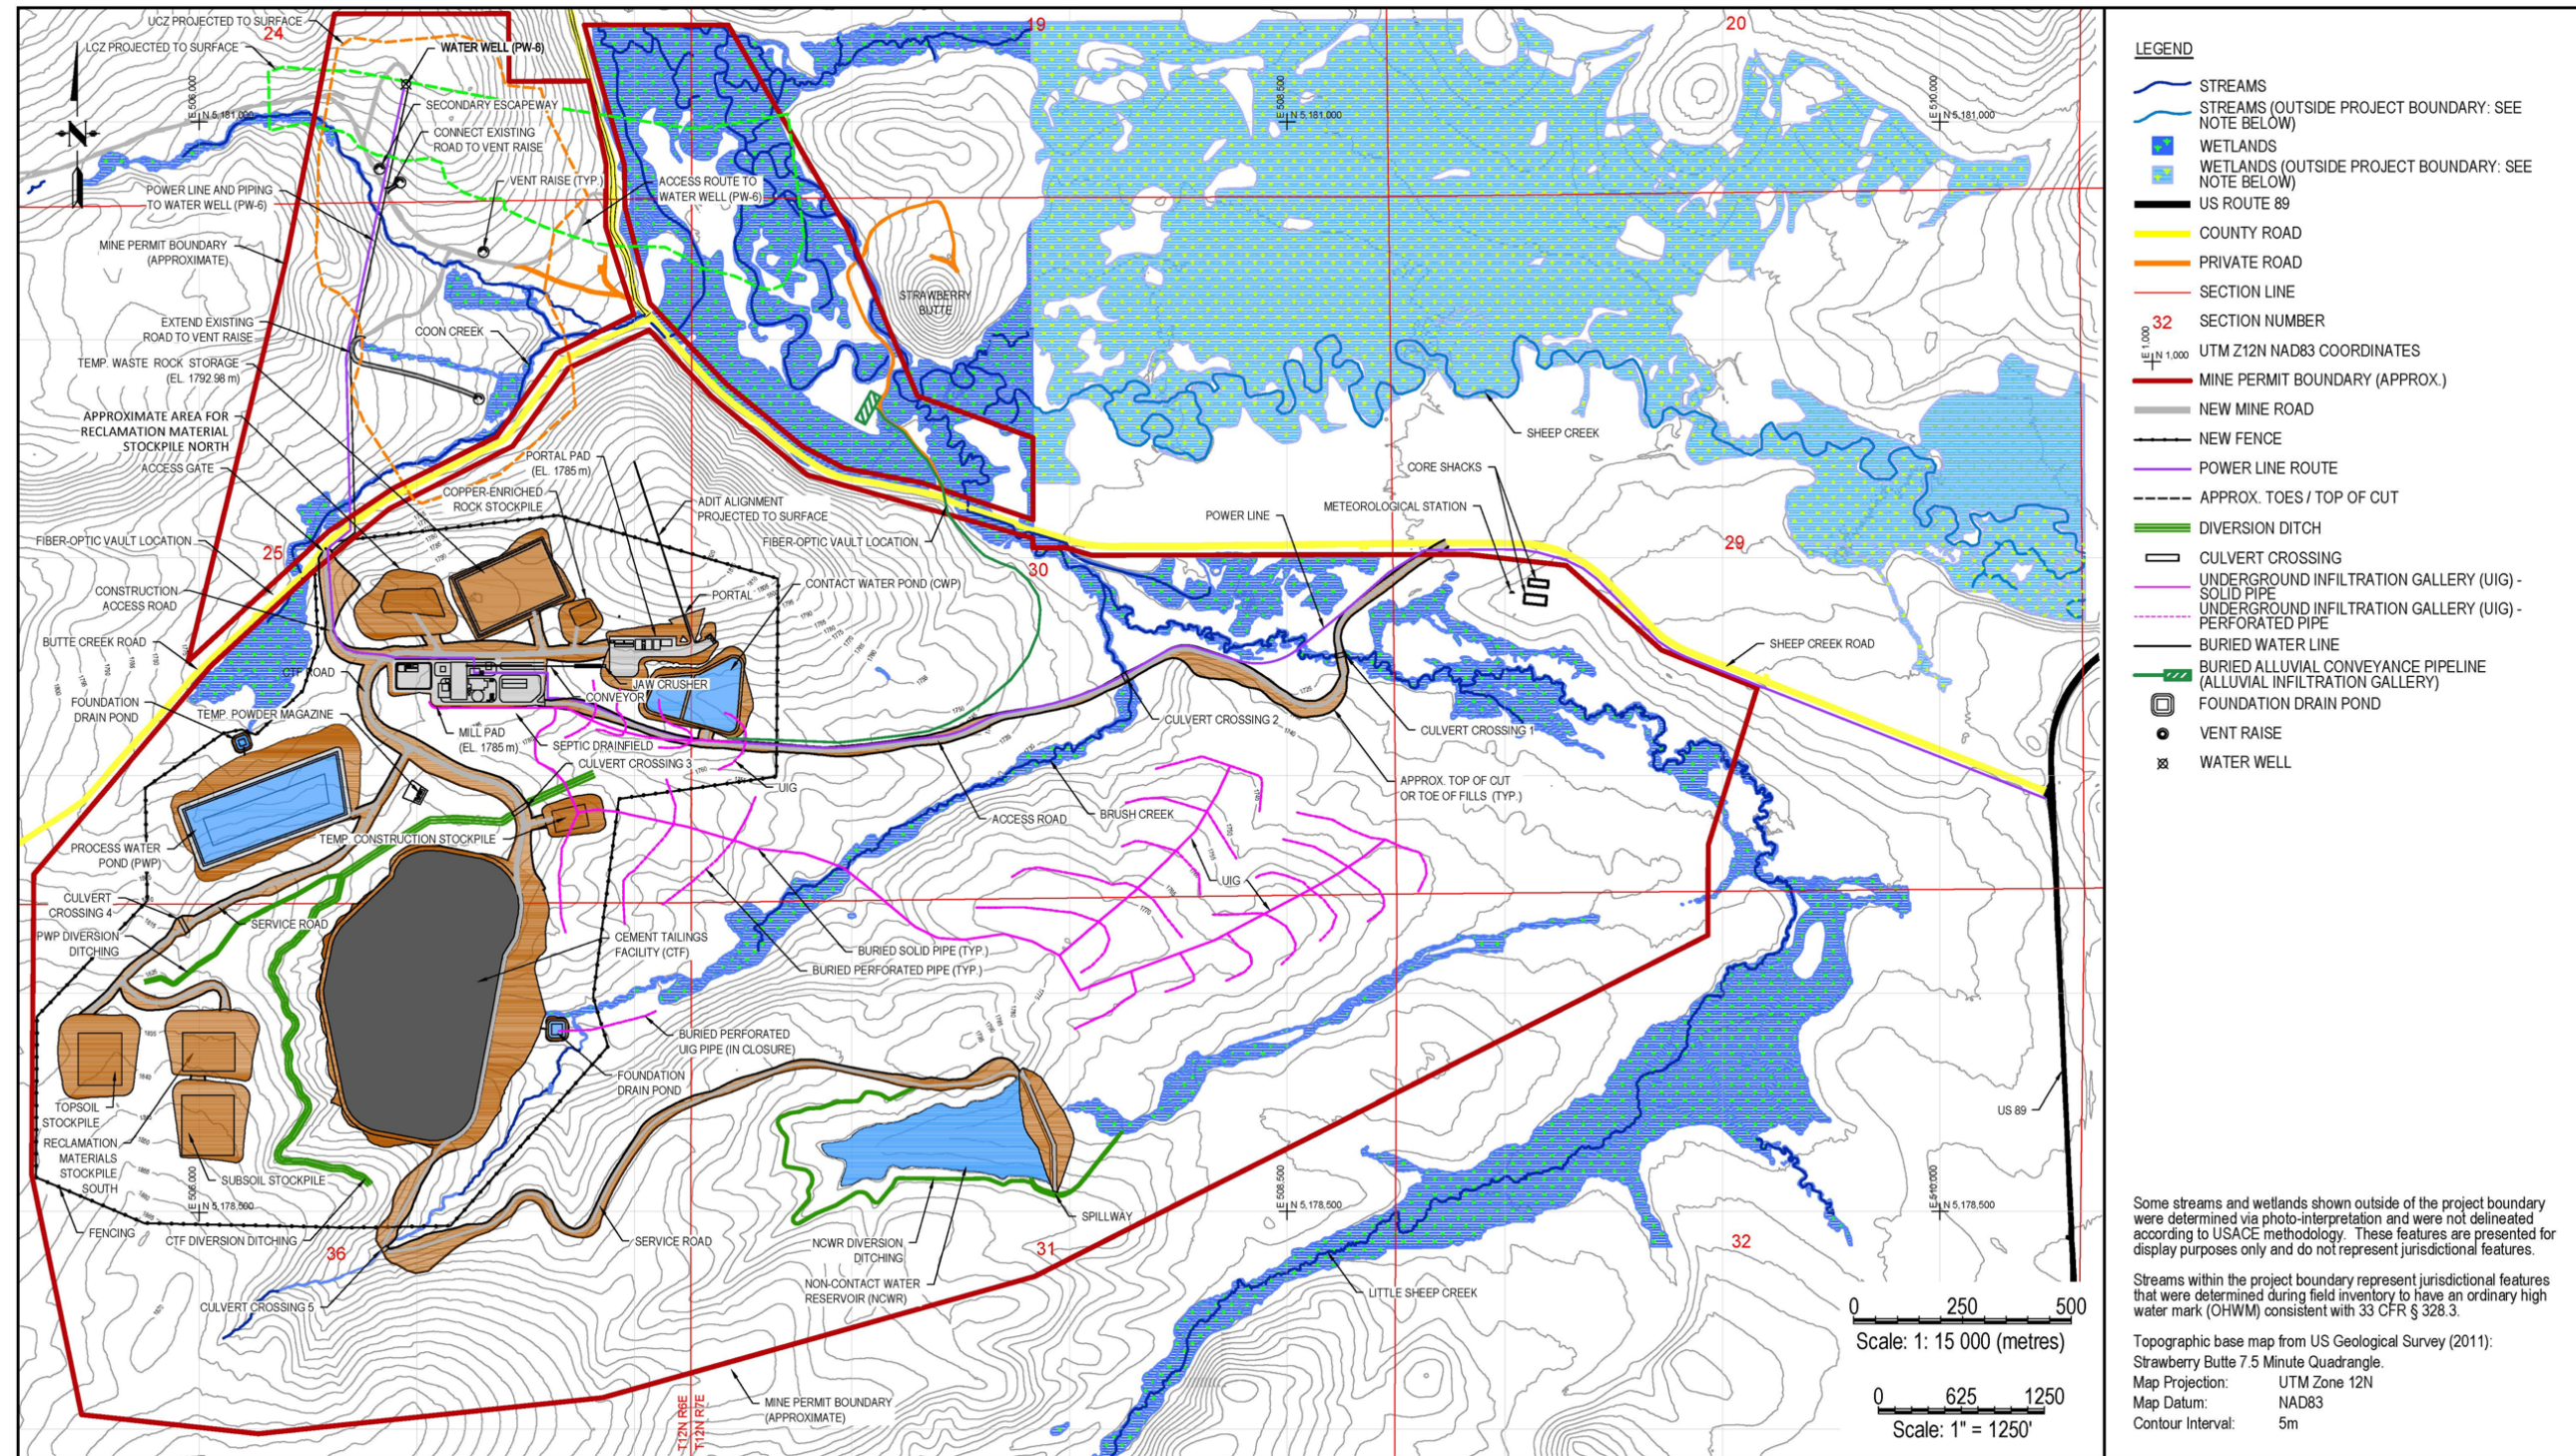

This report presents all geochemical data available for predicting the environmental impacts of the proposed mine facilities and anticipated alternative scenarios for the Black Butte Copper Project. For example, tailings have been tested using different percentages of binder amendment, in both subaerial weathering (as in a surface CTF) and within saturated zones (when placed as backfill, following closure). Tailings were also tested without amendment under subaerial and saturated conditions to evaluate tailings chemistry under alternative management scenarios. **Table 1-3** describes the intended application of the kinetic oxidation and metal release data in assessments of proposed and alternative facilities.

In addition to their use in facility design, geochemical data characterizing waste rock and tailings have been used as inputs for geochemical models of:

- Groundwater quality in the underground workings, operationally and post-closure;
- Seepage from temporary waste rock storage, which will be collected in the CWP;
- Water from the WRS, CTF, and PWP; and
- Inputs for design of an appropriate water treatment facility.

Modeling results are reported elsewhere (Enviromin, 2017c).

Raw Tailings	X	X	X	X	X	-
Paste Tailings 2%	X	X	X	-	X*	**
Paste Tailings 4%	X	X	X	-	X*	X
Paste Tailings 4% and Waste Rock	-	-	-	-	X*	X

\*Unsaturated HCTs conducted on intact cylinders, not crushed materials, as is indicated in the ASTM standard.

\*\*An attempt was made to subject a cylinder of paste tailings with 2% binders to diffusion testing, however, the cylinder did not maintain integrity for the first leachate "bath" and the test was terminated before any data were collected.

**TABLE 1-3. Kinetic Tests and Facility Scenarios**

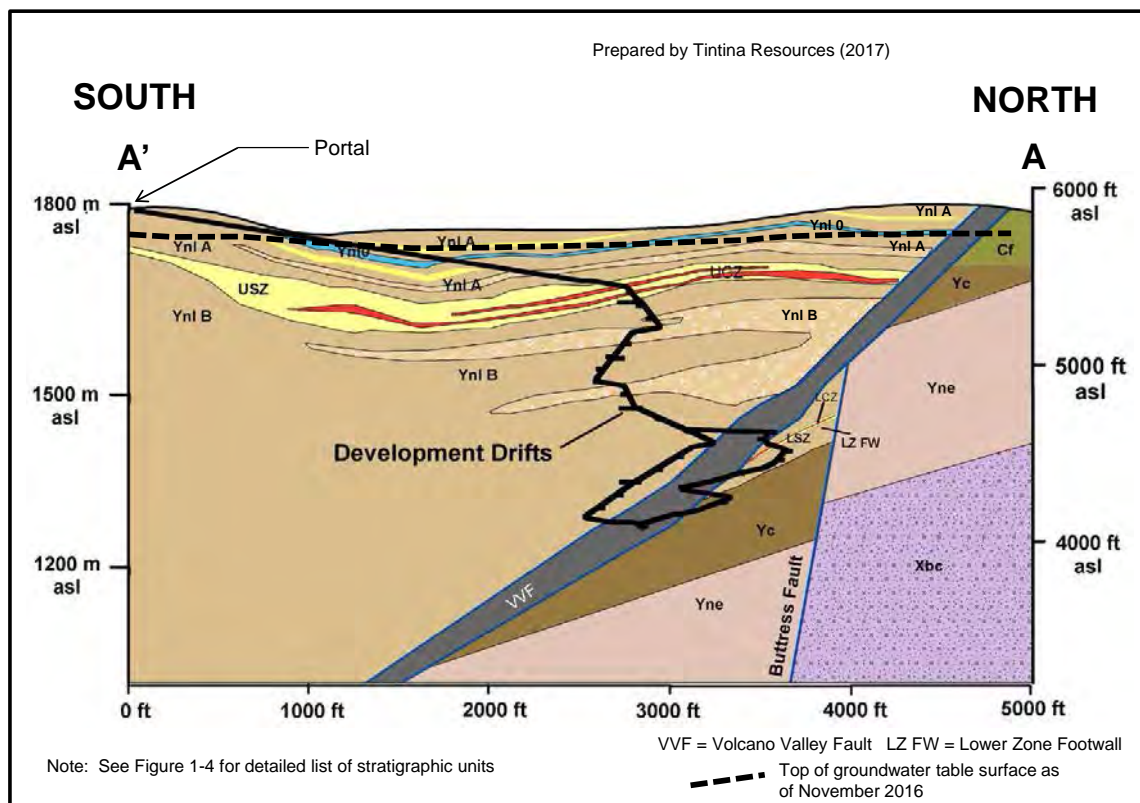

Waste Rock Management			
Action Scenarios	Facility Represented	Waste Rock Material	Test Method
Proposed	Underground Water Quality	HCT by Lithotype	ASTM method D5744 (HCT)
	Temporary Waste Rock Storage	HCT by Lithotype	ASTM method D5744 (HCT)
Tailings Management			
Action Scenarios	Facility Represented	Tailings Characteristics	Test Method
Proposed	Backfilled Paste in flooded workings	4% binder	ASTM C1308 diffusion test
	Cement paste in CTF, subaerial weathering	2% binder	ASTM method D5744 (HCT)
	Cement paste in CTF, subaerial weathering	4% binder	ASTM method D5744 (HCT)
Alternative	Saturated tailing e.g., subaqueous impoundment	Raw (non-amended)	Modified ASTM method D5744 (saturated HCT)
	Subaerial weathering, e.g., dry stack tailing pile	Raw (non-amended)	ASTM method D5744 (HCT)
Additional*	Cement paste in CTF, subaerial weathering	4% co-disposed with waste rock	ASTM method D5744 (HCT)
	Backfilled Paste in flooded workings	4% co-disposed with waste rock	ASTM C1308 diffusion test

\*Geochemical testing of paste tailings mixed with ROM was conducted to evaluate previously-considered scenarios that are no longer pertinent to Tintina's operational plans or foreseeable alternatives.

### 1.3 Geology

The Black Butte Copper deposit consists of two massive sulfide-Cu ore bodies within the mid-Proterozoic-aged Newland Formation of the Belt Supergroup. The Newland Formation is typically divided into a lower member that consists of primarily argillaceous dolomite and an upper member of interbedded shales and carbonates (Mogk D., 2015, personal communication; Graham *et al.*, 2012). A generalized cross-section that includes the proposed underground mine workings is included as **Figure 1-3**.

The locally massive sulfide-bearing sediments were deposited within the Helena embayment and exposed along the Volcano Valley thrust fault (VVF) at the end of the Laramide orogeny (Resource Modeling Inc., 2012). Copper ore is hosted in sulfide minerals within marine sediments associated with submarine hydrothermal vents, and contains varying amounts of primary and secondary pyrite, chalcopyrite, bornite, barite, and silica. Microfossils identified within the sulfide bodies at the Black Butte Copper project are suggestive of vent fauna grown on submarine hydrothermal vents. Approximately 2,460 feet (750 m) in total vertical thickness of interbedded sulfide mineralization has been defined, with approximately 1,230 feet (350 m) (in vertical thickness) of overlying and interbedded carbonate (Resource Modeling, Inc., 2012).

**FIGURE 1-3. Cross Section of Black Butte Copper Project**

The stratigraphy of the Newland Formation shales, dolomites, and interbedded sulfides is shown in **Figure 1-4**. The uppermost member of the Upper Newland Formation (*Ynu*), which is designated as *Ynu II* in Tintina’s geological model, is a black-gray thinly laminated to well-bedded silty dolomite that is typically less than 49 feet (15 m) thick. Black chert layers and nodules appear in core and outcrops, and are a diagnostic feature of the unit. A thin sulfide horizon known as the *II SZ* sulfide zone is developed at the contact between the *Ynu II* and the underlying *Ynu I*. Sheets of sulfide localized immediately below *Ynu I* provide a definitive stratigraphic marker, known as the *O/I SZ* sulfide zone, which indicates the transition to the more sulfidic Lower Newland Formation.

The uppermost portion of the Lower Newland Formation that will be intercepted by the decline above the upper sulfide zone (*USZ*) is identified operationally as *Ynl A*. This unit is comprised of interbedded black-grey laminar silts, dolostones, and shales. Upper and lower blocks of *Ynl A* are separated by a relatively thin interbed of stylolitic, medium grey dolomite known as *Ynl O* or “the Nose”. The *Ynl O* unit is the closest distinguishable carbonate bed overlying the *USZ*. Above the *Ynl O* unit, trace sulfide minerals occur in local zones of faulting and remineralization, commonly in association with calcite. Below the *Ynl O* unit, the *Ynl A* contains visible pyrite and barite laminations that increase with depth. The *USZ*, which hosts significant copper mineralization known as the Upper Copper Zone (*UCZ*), immediately underlies the lower block of undifferentiated *Ynl A* and can be up to 328 feet (100 m) thick (Resource Modeling, Inc., 2012). The *Ynl B* unit that lies between the *USZ* and the underlying Lower Sulfide Zone (*LSZ*) is comprised of shale and conglomerate.

Prepared by: Tintina Resources (2016) Abbreviations: Fm = Formation; FW = footwall; hwd = hanging wall dolomite SZ = Sulfide Zone; LZ FW = Lower Zone Footwall  
Other geologic units not listed on this stratigraphic section but that are included in the mine permit area include: Ts (Tertiary sediments) and Paleozoic cover units (Cw = Wolsey Formation; Ct = Flathead sandstone; cg = conglomerate interbeds in Ynu and Ynl; and ls = limestone interbeds in the Ynu and Ynl. The Ynl unit is divided into the Ynl A and the Ynl B subunits relative to the location above or below the USZ, respectively.

**FIGURE 1-4. Black Butte Copper Project, Generalized Stratigraphic Column**

The *USZ*, which hosts Cu- mineralization in the calcareous shale of the Lower Newland Formation, contains fine-grained bedded pyrite up to 180 feet (55 m) thick with three chalcopyrite-rich zones. Bornite and chalcopyrite occur more frequently in the southern part of the *USZ*. The cobalt minerals are unknown but are most likely cobaltite or glaucodot. Economic grade mineralization associated with the *USZ* is specifically hosted in the *UCZ*.

Economic grade mineralization known as the Lower Copper Zone (*LCZ*) is hosted within the *LSZ*. The proposed mine workings will access the *LCZ* and are oriented to address the structural definition of this zone by the Volcano Valley Fault (*VVF*) and the Buttress Fault. The *VVF* is a clay-rich shear zone approximately 33 feet (10 m) thick. The Buttress Fault is a steeply dipping normal fault that traverses through the Neihart Quartzite unit (*Yne*). Due to its close proximity to mine workings, *Yne* has been included in the geochemical characterization program for potential use as a construction material. The *LCZ* is also proximal to the Chamberlain Shale (*Yc*), which contains disseminated pyrite and proportionally less carbonate than the *Ynl A*. Between the lower zone footwall and the top of the *Yc* is a silicified unit comprised of shale and debris flow material that has been designated as the Lower Zone Footwall (*LZ FW*). This unit contains highly altered dolomite and is locally silicified below the *VVF*. The *LZ FW* is characterized by erratic sulfide mineralization, including disseminated chalcopyrite and pyrite as well as some ore stringer veinlets. There are very isolated occurrences of gold minerals in the *LZ FW*, which is almost completely devoid of cobalt (Co) and arsenic (As).

A list of the minerals relevant to the environmental geochemistry of waste rock for each major lithotype is provided in Table 1-4.

## 2 Sampling

The environmental geochemistry of rocks that will be mined from the Black Butte Copper Project will be influenced by sulfide, carbonate, and metal-bearing minerals. Representative samples of waste rock, tailings, and construction (excavation) materials were therefore identified for analysis. Samples of homogenized “raw” tailings were created by flotation during metallurgical testing (conducted at SGS Laboratories, Vancouver, CA). AMEC Foster- Wheeler produced the various paste-amended tailings samples. Enviromin was provided splits of all “raw” non-amended tailings and paste tailings for geochemical testing.

To ensure representative sample selection for waste rock and construction materials, statistical sampling techniques were applied to the multi-element whole rock data (from the exploration database) in order to select sample subsets for environmental geochemical testing. Comparable, but not identical, methods were used in the identification of representative samples by Tetra Tech in 2012 for the *Ynl A*, *Ynl B*, and *USZ* lithotypes, and by Enviromin in 2015 for *USZ*, *Ynl B*, and *LZ FW*. Tetra Tech selected representative samples across the distribution of each multi-element data set visually, as described in the Final Black Butte Copper Project Baseline Environmental Geochemistry Evaluation for the 2012 Johnny Lee Decline, which is included as

**Appendix A.** This approach was revised during the 2015 environmental geochemical testing program to determine the number of subsamples needed to represent the mean exhibited by the larger pool of available data for each lithotype using a method based on Runnells *et al.*, 1997. The number of samples identified for each lithotype is shown with boxplots comparing the sample subsets with the overall population in **Appendix B**.

An initial group of eight samples was selected across the range of observed chemistry for each lithotype, based on the histogram approach defined by Tetra Tech, with the initial goal of representing the range of sulfur (S) concentrations. Enviromin chose to begin with S distribution because S is a master variable of environmental geochemical concern to Tintina and is directly associated with the potential release of metal(loid) elements of environmental interest. Following selection of the initial eight subsamples, additional subsamples were progressively added through random selection until the means of the subset were equivalent to the means of the original lithotype exploration dataset.

Subsequent to completion of the 2012 Decline report (**Appendix A**), kinetic humidity cell tests were conducted on most of the composites constructed during the 2012 Decline geochemical testing program. Specifically, equal proportions of the two *USZ* composites (one designated “High Fe” and the other “Low Fe”) were combined to form a single composite labeled “*USZ 1/2*”; the two *Ynl A* composites were combined to form a single composite labeled “*Ynl 1/2*”; and the *Ynl 0* and *Ynl B (2012 Decline)* composites were used as originally designed for kinetic testing. The *IG* and *Ynl B (original 2011 decline)* composites were not included in the kinetic testing program, as they did not represent significant tonnage to be mined from the 2012 Decline.

Sample subsets selected in 2015 were individually tested for static parameters and then composited. Specifically, acid-base accounting (ABA) and net-acid generation (NAG) tests were conducted on each sample, after which samples were composited for metal mobility, asbestiform mineral analysis, and kinetic tests. These composites were constructed by using equal masses of each sample in the lithotype subsets. For example, for the *USZ* material, the 15 selected *USZ* subsamples, which had been individually analyzed for ABA and NAG, were composited into a single sample. Intervals selected for the in the 2015 geochemical testing are presented in **Table B-2 of Appendix B**.

### 3 Waste Rock Characterization

The geochemical testing of waste rock for the Black Butte Copper Project was initially focused on the 2012 Decline, which included static and/or kinetic testing of the relevant lithotypes: *IG*, *Ynl A*, *Ynl 0*, *Ynl B*, and *USZ*. When the focus was shifted from the 2012 Decline to an operational-scale plan, the baseline geochemical testing program was updated to identify where the 2012 work had not fully characterized waste rock lithotypes and based on site-wide ICP-MS exploration data. For example, the 2012 analysis of *Ynl A* involved samples that were representative of multi-element chemistry site-wide, while the 2012 analyses of *Ynl B* and *USZ* did not. The *Ynl A* lithotype, thus, did not require additional testing, while the *Ynl B* and *USZ* lithotypes did. The *LZ FW*, *Yne*, and *Yc* were also added as lithotypes.

Due to changes in the mine plan during 2014 and 2015, the *Yne*, *Ynl 0*, *IG*, and *Yc* were determined to represent <1% of waste rock tonnage. Therefore, while they have been characterized thoroughly, they are not relevant to Tintina’s final mine plan. The entire waste rock characterization program is described here, but the discussion is focused on

results for the lithotypes expected to contribute significantly to waste rock tonnages: *Ynl A*, *USZ*, *Ynl B*, and *LZ FW*.

### 3.1 Static Testing of Waste Rock

Static testing methods were primarily used to evaluate acid generation potential, although some static testing also investigated metal release potential. Static testing refers to analysis at a fixed point in time and differs from kinetic testing, which measures changes in oxidation and solute release over time. Multi-element analyses of rock composition (ICP, collected as part of assay tests) were used to evaluate whole rock metal content. The acid base accounting (ABA) and net acid generation (NAG) tests were used to evaluate potential for acid generation, and the EPA method 1312 Synthetic Precipitation Leachability Procedure (SPLP) was used to evaluate potential metal mobility for some lithotypes. Additional static testing included in the Black Butte Copper Project geochemistry program included testing to rule out the presence of asbestiform minerals and mineralogical analyses (**Table 1-1**). A detailed description of the tests used to characterize the waste rock, and a summary of results, is provided below.

#### 3.1.1 Multi-Element Whole Rock Chemistry

Multi-elemental analyses of rock composition, measured during the exploration program, provided a solid basis for the selection of subsamples for use in environmental geochemical characterization. Whole-rock data are also useful for “fingerprinting” samples during mining operations and can be correlated with those included in this baseline geochemical study.

Elemental composition was determined using inductively coupled plasma-atomic emission spectroscopy (ICP-AES) following a 4-acid digestion with a mixture of perchloric, nitric, hydrofluoric, and hydrochloric acids to dissolve the mineral matrix, including the silicates. The results of the multi-element analyses are summarized in **Appendix B**, and demonstrate the elemental variation between lithotypes.

#### 3.1.2 Acid Base Accounting and Net Acid Generation

Sulfide minerals in waste rock, particularly pyrite, react with water and oxygen to produce sulfuric acid ( $H_2SO_4$ ), which can be neutralized by minerals capable of consuming acid, such as calcite. Two tests were used to measure potential for acid production, acid base accounting (ABA) and the net acid generation test (NAG). Results of these tests allow rock to be classified as Potentially Acid Generating (PAG) rock or Non-Acid Generating (NAG) rock, as discussed below.

The ABA test measures the relative acid production and neutralization properties of a mine waste material based on the conservative assumption that all sulfide present will oxidize, releasing acidity. The ABA test quantifies the acid production potential (AP) and neutralization potential (NP) of a sample in units of tons  $CaCO_3$  / kiloton of rock (Sobek et al. 1978), allowing calculation of the net neutralization potential (NNP) as NP less AP, as well as the ratio of NP to AP (INAP, 2012). The ABA test uses a relatively complete digestion of finely ground rock, and therefore conservatively estimates the reactivity of available sulfide minerals.

To determine NP, a sample is treated with excess standardized hydrochloric acid (HCl) at ambient temperatures for 24 hours. After the test is complete, the remaining acid is titrated with a standardized base to pH 8.3 to allow the calculation of calcium carbonate equivalent for acid consumed. Early analyses used the Sobek method, and later

analyses followed the modified Sobek method of ABA analysis (Lawrence and Wang, 1996). The difference between these two methods is that the latter uses a fizz test to adjust the amount of acid used in an alkalinity titration. Because of the change in method, a comparison of select samples from key rock types was conducted and showed that these methods produced consistent results in this style of mineralization.

In this study, Enviromin applied detection limits to the analytical NP values reported by the ALS Laboratories, to provide for meaningful interpretation of these data. While the analytical procedure allows for measurement of negative NP values, a negative NP value reflects the production of acidity, which is accounted for in the AP portion of this test. The NP can be  $\geq 0$  in terms of t CaCO<sub>3</sub>/ kton rock. Therefore, Enviromin converts negative NP values reported by ALS into “<1” values, which reflects the resolution for this analysis.

As part of the ABA analysis, S was fractionated to identify the sulfide content, acid-soluble and -insoluble sulfate, and residual S fractions. Total S was determined by LECO S, and sulfate S was measured by analysis of the carbonate-soluble and HCl-soluble fractions. Sulfide was then calculated by subtracting total sulfate from total S.

In this study, Enviromin recalculated AP based on sulfide S (not total S, as reported by ALS), which was the dominant form of S measured in most samples. This adjustment, along with the detection limits used in place of negative NP values, allowed recalculation of NP:AP and NNP. All recalculated NP:AP ratios and NNP values were held to the ALS’ limits of reporting (LOR; 0.01 and 1, respectively), effectively setting detection limits (at the LOR) for these analyses.

The acid generation potential of rock samples is assessed based on calculated values of NNP and NP:AP using the ABA criteria shown in **Table 3-1**. The criteria are also used to identify materials that require kinetic testing in humidity cells to evaluate acid generation and metal release potential under prolonged weathering stress.

**TABLE 3-1. Criteria for Classifying Acid Generation Potential from ABA Data**

Classification	ABA Criteria
Potentially Acid Generating (PAG)	NP:AP < 1 and NNP < -20 tons/kton as CaCO <sub>3</sub>
Uncertain Acid Generation Potential	NP:AP between 1 and 3 and/or NNP between -20 and +20 tons/kton as CaCO <sub>3</sub>
Unlikely to Generate Acid (NAG)	NP:AP > 3 and NNP > +20 tons/kton as CaCO <sub>3</sub>

*From BLM (1996) and USEPA (1994).*

The net acid generation pH (NAG pH) test is another method of evaluating acid generation potential, which relies on the oxidation of a ground sample using hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>, Miller et al, 1997). All sulfides are oxidized, and available minerals neutralize any acid produced. The NAG pH method avoids the potential bias of assumptions implicit in the ABA method, including the assumed stoichiometry of sulfide mineralogy and the relative efficiency of speciation methods.

A 2.5 gram sample is pulverized and 250 mL of 15% H<sub>2</sub>O<sub>2</sub> is added. The sample reacts overnight, and is then heated for up to 2 hours to remove excess H<sub>2</sub>O<sub>2</sub> and encourage the release of inherent neutralizing capacity. The sample is allowed to cool, ending pH (NAG pH) is measured, and the solution is then titrated with sodium hydroxide, to endpoints of pH 4.5 and 7.0. Samples with a NAG pH of less than 4.5 at completion of

the test indicate potential to generate acid, and titration results further indicate the material's acid-production ability (**Table 3-2**).

**TABLE 3-2. Criteria for Classifying Net Acid Generation Potential**

NAG Prediction	Detailed Prediction	Final NAG pH	NAG Value (t H <sub>2</sub> SO <sub>4</sub> / 1000 t)
Potentially net acid generating (PAG)	High capacity	<4.5	>5 (up to 10, depending on site-specific factors)
	Low capacity	<4.5	0-5
Potentially non-net acid generating (NAG)		>4.5	0

Adapted from: Miller et al. 1997, and INAP, 2012

**Figures 3-1 and 3-2**, as well as **Tables 3-3a and 3-3b**, present a summary of ABA and NAG results for all tested lithotypes. ABA and NAG results for individual samples are compared with the guidelines presented in **Table 3-1** and **Table 3-2**. Lab reports for ABA and NAG analyses completed prior to 2013 are included in the 2012 Decline report (**Appendix A**, note that *Ynl A* was formerly referred to as “*Ynl*” and appears with that label in laboratory results). Lab reports for samples analyzed following completion of the 2012 Decline report are presented in **Appendix B**.

Results for the *Ynl A* lithotype indicate that most of this unit will be non-acid generating. However, there are sulfidic stringers present in the undifferentiated Lower Newland Formation, especially in proximity to the *USZ*. The presence of locally greater sulfide content is reflected by the “uncertain” and potentially acid-generating characteristics of a small number of samples (**Appendix B**).

The results of ABA and NAG analyses demonstrate that of the four dominant lithotypes, only the *USZ* material is consistently rated as potentially acid generating (PAG), with no samples rated as NAG and select samples rated as having an “uncertain acid generation potential.” Because this material represents approximately 28% of the expected waste rock tonnage, Tintina has conducted two kinetic tests of this material.

The *Ynl B* lithotype is also expected to contribute significantly to the waste rock tonnage (32%). Based on ABA and NAG test results, this material is not expected to produce significant acid. These static results include data collected in both the 2012 and 2015 geochemical testing programs and represent a robust dataset for this material (**Figures 3-1a, 3-1b, and 3-2; Tables 3-3a and 3-3b; and Appendix B**). Kinetic tests of *Ynl B* samples collected near the 2012 decline, and site-wide (2015), have been conducted.

The *LZ FW* lithotype, which constitutes approximately 35% of the expected waste rock tonnage, exhibited an uncertain potential for acid generation. This unit is defined spatially and contains multiple lithologies with variable mineralogy ranging from acid neutralizing to potentially acid generating (**Appendix B**). This material has been further evaluated in a kinetic humidity cell test.

The 2012 and 2015 geochemical testing programs also included testing of lithotypes representing less than 1% tonnage. All static data for the *Ynl O* and *IG* lithotypes were reported in the 2012 Decline Report (**Appendix A**) and are included in this report for comparison with other lithotypes. The ABA and NAG results for the two remaining lithotypes, *Yne* and *Yc*, are briefly described here. Both the *Yne* and *Yc* lithotypes exhibited varying potential for acid production ranging from uncertain to non-acid

generating. None of the individual samples were classified as PAG. Kinetic testing was not conducted for the *Yne*, as its tonnage is insignificant, but potential use of the *Yc* lithotype in construction supported its testing in a humidity cell.

### 3.1.3 Metal Mobility Tests

The Synthetic Precipitation Leaching Procedure (SPLP) is U.S. EPA method 1312 (2007). This test is designed to determine the mobility of metals in soils and mine wastes. For mines in the western U.S., waste rock is digested using a non-buffered pH 5 solution acidified with 60% sulfuric acid and 40% nitric acid, at a liquid-solid ratio of 20:1. The sample is rolled in a closed bottle for 18 hours, after which the sample is filtered using a 0.6-0.8  $\mu\text{m}$  filter and analyzed for total recoverable concentrations of constituents of interest at detection levels appropriate to regulatory standards, typically using ICP-AES or ICP-MS. The final pH is also measured.

The SPLP provides an indication of metals that have potential to be released from rock exposed to meteoric water. However, the actual metal concentrations are sensitive to the rock:water ratio used in the test, as well as the final pH. For rock which may undergo oxidation-related changes in pH, the SPLP may not fully represent metal release. Concentrations measured in extracts should therefore be interpreted with caution (Fey, 2003).

The SPLP test was used for all lithotypes studied in 2012 and *Yne* in 2015, but the confined headspace during testing lead to a problem with supersaturated carbon dioxide concentrations (a result of degassing of carbon dioxide from rock), which artificially elevated pH. This pH bias in SPLP results, likely influenced metal solubility, suggesting that these metal data are not reliable for materials that could undergo sulfide oxidation and which, therefore, may produce lower pH water. Metal mobility predictions were based instead on subsequent kinetic tests, as described below. The one exception to this was the use of the SPLP to evaluate metal release potential for the *Yne* quartzite, which has low carbonate and minimal metal release potential (based on whole rock chemistry). The results of this and the 2012 SPLP analyses (for comparison) are presented along with relevant MT DEQ groundwater standards in **Table 3-4**. In these alkaline solutions, where final pH was 9.9, most metal concentrations were below detection.

The lab report for the *Yne* sample is included in **Appendix B**, while lab reports from the 2012 Decline investigation were presented in the 2012 Decline Report, which is included here as **Appendix A**. Note that *Ynl A* was formerly referred to as “*Ynl*” and appears with that label in laboratory results.

### 3.1.4 Asbestiform Minerals

Asbestiform serpentine and amphibole minerals are generally associated with metamorphic processes and do not typically occur in carbonaceous sedimentary deposits. Chrysotile fibers are most commonly found where serpentinized ultramafic intrudes dolomitic marbles. Although amphibole minerals are widely found throughout the earth's crust, few varieties exhibit the rare asbestiform habit resulting from mechanical shearing and/or high temperature metamorphism, which pose health risks. Asbestiform mineralization is therefore highly unlikely in the Black Butte copper deposit. Nevertheless, composites of lithotypes were screened for the presence of asbestiform minerals at the request of the Montana Department of Environmental Quality.

The presence/absence of chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite was evaluated by the R.J. Lee Group using Polarized Light Microscopy (PLM) methods at a 400 point count, followed by evaluation of any identified asbestiform fibers following U.S. EPA regulations. Any samples found to contain uncertain or demonstrated asbestiform mineral content were to be analyzed using Transmission Electron Microscopic (TEM) analysis to clearly distinguish between mineral cleavage and fibers, along with elemental analysis of the samples. For this project, detection between 0.001 and 0.1 weight percent was required.

In the 2012 Decline geochemical investigation, no asbestiform minerals were identified in the USZ, Ynl A, Ynl O, Ynl B, or IG. These results are presented in the March 2013 Baseline Environmental Geochemistry Report, included as **Appendix A**. Note that Ynl A was formerly referred to as "Ynl" and appears with that label in laboratory results.

In the current geochemical characterization program, additional lithotypes, including Yc, Yne, and LZ FW, were also screened for the presence of asbestiform minerals. Lab reports for samples analyzed after 2012 are provided in **Appendix E**. None of the samples submitted for asbestiform mineral screening contained detectable asbestos using PLM analysis (**Table 3-5**). For this reason, confirmation testing using TEM methods was not warranted.

**TABLE 3-5. Results of 2012 and 2015 Asbestiform Mineral Testing**

2012 Asbestiform mineral data are presented here for comparison with the 2015 data.

### 3.2 Kinetic Testing of Waste Rock

Humidity cell tests (HCTs) are designed to study the rate of sulfide mineral oxidation and are often used to simulate long-term metals leaching in aerobic (accelerated weathering) environments. Typically, HCTs are run using established American Society for Testing and Materials (ASTM) testing protocols. Crushed rock is placed in a column and aerated with alternating cycles of humid and dry air, followed by weekly flushing with a relatively large volume of water (approximately 2 pore volumes). The column is allowed to drain and the cycle is repeated weekly for what has conventionally been a 20-week period. However, there are no fixed timelines for HCT duration, which should be determined by evidence of steady state in key reaction rates, such as sulfide oxidation and depletion of alkalinity.

Kinetic tests that are strongly alkaline, show no evidence of metal release, and contain little to no sulfide mineralization, or those that are strongly acidic, may not require more than 20 weeks of testing. A shorter period of testing may be sufficient to meet risk management and data objective requirements. However, tests of materials that are equivocal and show ongoing sulfide oxidation may require much longer periods of testing to evaluate the potential for development of acidic conditions.

Alternatively, termination of tests can be determined based on risk management protocols. For example, although the 2012 HCT test of *USZ* rock from the 2012 Decline did not produce acidic leachate, the high potential for acid production indicated by static testing led Tintina to stipulate that the *USZ* waste would be handled as PAG. As a result, this HCT was terminated at 24 weeks in spite of continued sulfate production. A subsequent need was identified to predict metal release under sulfide oxidizing conditions in this unit, site-wide, and so a second test was initiated. In most cases, as a practical matter, humidity cell duration is currently determined by the supervising geochemist with regulatory and other stakeholder input.

Water collected from the column is analyzed for sulfide oxidation and neutralization parameters (e.g., pH, redox potential (Eh), sulfate, alkalinity, acidity, and Fe speciation) each week, and periodically for metals. The suite of metals is typically determined from mineralization style and regulatory requirements, and the reporting limits for analysis are based on both regulatory requirements and data quality objectives (i.e., modeling goals).

All waste rock HCTs for the Tintina Black Butte Project were conducted by McClelland Laboratories of Sparks, Nevada using the (ASTM) 5744-07 method. Sulfide oxidation and acid neutralization parameters were measured weekly in the column lab, and effluent collected during weeks 0, 1, 2, 4, and every fourth week thereafter was analyzed for a comprehensive suite of metals by Energy Laboratories in Billing, Montana. In this geochemical testing program, sulfate was analyzed both in weekly effluent by McClelland Laboratories, as well as in the periodic effluent sent to Energy Laboratories. All HCT data are presented in **Appendix C**, and a selection of the most relevant data is presented below in text and figures.

The Tintina Black Butte Project kinetic tests were conducted in two series. During the 2012 Decline geochemical testing program, four HCTs were commissioned, one for each of the following lithotypes: *USZ*, *Ynl 0*, *Ynl B*, and *Ynl A*. When the focus shifted to the operational scale plan in late 2014, and new lithotypes were added to the waste rock characterization program, a second set of kinetic HCTs were initiated, including the *USZ*, *Ynl B*, *LZ FW*, and *Yc* lithotypes.

### 3.2.1 2012 Decline Kinetic Testing

Subsequent to completion of the 2012 Decline report, Tintina elected to proceed with kinetic testing of the *USZ*, *Ynl A*, *Ynl 0*, and *Ynl B* materials, which would have contributed significant proportions of the waste rock tonnage for the 2012 Decline. Composites for HCTs were constructed as follows: equal proportions of the two *USZ* composites (one designated “High Fe” and the other “Low Fe”) were combined to form a single composite labeled “*USZ 1/2*”; the two *Ynl A* composites were combined to form a single composite labeled “*Ynl 1/2*”; and the *Ynl 0* and *Ynl B (2012 Decline)* composites were used, as originally designed, for kinetic testing. The *IG* and *Ynl B (original decline)* composites were not included in the kinetic testing program, as they were no longer considered significant lithotypes. Both the *USZ* and the *Ynl 0* columns were decommissioned after week 24. The *Ynl B* and *Ynl A* columns were decommissioned after weeks 62 and 88, respectively. The results of each kinetic humidity cell test are discussed below, including figures of select weekly parameters and periodic metals, by lithotype. Tabulated data are presented in **Tables C-1** and **C-2** of **Appendix C**.

An understanding of the sulfide and carbonate mineralogy of the tested materials, as well as the mineral residence of elements detected in humidity cell effluent, is important for the correct interpretation of kinetic tests results. The results of all mineralogical analyses of humidity cell leached rock are discussed below and presented in detail in Appendix F of this report.

The mineral residence of thallium (Tl) and selenium (Se), which were elevated in some HCT effluents, was of particular importance in interpreting the results for this project. The Black Butte Copper deposit is hosted in interbedded shales and dolomitic carbonates, with locally massive sulfide mineralization containing primary and secondary pyrite, chalcopyrite, bornite, barite, and silica. Commonly recognized, naturally-occurring Tl-rich minerals such as lorandite (TlAsS<sub>2</sub>) and crookesite [Cu<sub>7</sub>(Tl,Ag)Se<sub>4</sub>] are not known to occur in the deposit. Because Tl occurs naturally in soils, predominantly as the charged ion Tl<sup>+</sup>, and can occur as a cationic substitute for potassium in aluminosilicate minerals, the Tl in leachate from the *USZ* and *Ynl A* columns may result from desorption or weathering of those minerals. Tl also displays chalcophile characteristics and has been found to occur with sulfides such as pyrite, sphalerite, and galena.

In order to better understand the sources of sulfate production and metal release (particularly of Tl and Se in the humidity cells), weathered samples collected from humidity cells in 2012 were analyzed by mineral liberation analysis (MLA) at the following times:

- *USZ* collected at 24 weeks;
- *Ynl 0* collected at 24 weeks;
- *Ynl B* collected at 33 weeks; and
- *Ynl A* collected at 33 weeks.

Additionally, a non-weathered sample of *Ynl A* from the composite used for HCT construction was analyzed as a basis for comparison, based on the assumption that the trace element content would be highest in non-weathered material. All mineralogical analyses were conducted by the Center for Advanced Mineral & Metallurgical Processing (CAMP) at Montana Tech in Butte, Montana.

Analyses conducted on the four weathered samples included MLA by scanning electron microscope-electron dispersive spectroscopy (SEM-EDS), sparse phase liberation (SPL), as well as x-ray mapping. The non-weathered *Ynl A* sample was subjected to

heavy liquid separation (HLS) to separate the heavy (dense, sulfide-rich) and light (silica-rich) mineral fractions, followed by inductively-coupled plasma analysis of a 4-acid digested sample and MLA of the two fractions.

No specific Se- and Tl-bearing minerals were detected in any of the analyses of *USZ*, *Ynl 0*, *Ynl B*, and *Ynl A* undifferentiated rock. ICP analysis of the HLS “float” and “sink” fractions of the non-weathered *Ynl A* sample revealed higher concentrations of cadmium (Cd), Fe, nickel (Ni), and Tl in the dense, sulfide-rich “sink” fraction. This suggests that Tl is present at trace levels in pyrite, because no specific Tl-bearing mineral was identified.

The CAMP report describing these analyses is included in **Appendix C**. Note that *Ynl A* was formerly referred to as “*Ynl*” and appears with that label in this report.

### 3.2.2 2015 Kinetic Testing

In 2015, Tintina elected to begin kinetic tests on the previously uncharacterized *Yc* and *LZ FW* lithotypes, while also conducting tests on newly generated composites of the *USZ* and *Ynl B* materials, which were developed to better represent these lithotypes at the site-wide, operational scale. Despite changes in mine design altered the waste rock proportions that rendered *Yc* insignificant in terms of tonnage, this baseline test was conducted and the data are reported below.

These tests were initiated in June 2015. The *Yc* and *Ynl B*, *LZ FW*, and *USZ* HCTs were terminated at 38, 36, 56, and 73 weeks of testing, respectively. All data are presented in **Tables C-3 and C-4** of **Appendix C** and major trends are discussed below, by lithotype.

### 3.2.3 Kinetic HCT Results by Stratigraphic Unit

Below is a detailed summary, by stratigraphic unit, of all kinetic HCTs conducted during the 2012 and 2015 geochemical testing programs for the Project. Where applicable, weekly extract data are discussed in mg/kg, and mg/L values are in parentheses. Periodic metals data are discussed in mg/L only to allow for comparison with MT DEQ groundwater quality standards. All results of the 2012 and 2015 HCTs are summarized in **Tables C-1 through C-4** of **Appendix C** and all applicable results are compared to MT DEQ water quality standards (MT DEQ, 2012) with hardness-dependent criteria adjusted for an average background water hardness of 130 mg/L. The final reports of kinetic HCTs from McClelland Laboratories, for both the 2012 and 2015 geochemical testing programs are included in **Appendix C**. These final reports also include Energy Labs’ reports of effluent analyses. Note that *Ynl A* was formerly referred to as “*Ynl*” and appears with that label in laboratory results.

#### **2012 *Ynl A* - Undifferentiated Lower Newland Formation (4% Waste Rock Tonnage)**

The lower Newland Formation composite was comprised of highly carbonaceous, locally sulfidic black shale collected from multiple intervals within the stratigraphic section between the *Ynl 0* “nose” and the *USZ* unit. As one approaches the *USZ* from above, the frequency and magnitude of sulfide stringers increases. While there is some sulfidic material included in the *Ynl A*, and thus in the sample of rock used to construct the column, the NNP and NP:AP characteristics summarized above and in **Appendix B** indicate that it is strongly net neutralizing. The consistently circum-neutral pH observed throughout the 2012 *Ynl A* kinetic testing supports this assessment. This material has less sulfide than the *USZ*, as evidenced by the cumulative production of sulfate from this cell after 88 weeks is approximately 40% of that observed in 24 weeks of testing of the 2012 *USZ*. Nevertheless, like the *USZ*, this cell showed stable, ongoing sulfate

production, which increased sharply at 20 weeks, peaked mid-test, and then slowly returned to original rates. This pattern of sulfate release was also reflected in other HCTs of related material (2012 *Ynl B*, 2015 *Ynl B*, (discussed below) and *Ynl Ex*, Enviromin, 2017b). However, in this HCT the very slow drop in sulfate required a prolonged test period, and this cell was terminated when sulfate stabilized at values close to original rates of release in week 88 (**Figure 3-3** and **Appendix C**).

- Effluent pH was principally alkaline for the duration of the test and the overall average pH was 7.27. Values for pH ranged from 6.77 in week 0 to 7.36 in week 88, with a maximum pH of 7.75 observed in week 55.
- Apart from week 0, redox potential was oxidizing for the duration of the test, and had an average value of 224 mV.
- After an initial period of high conductivity during weeks 0-2, values decreased to between 200 and 400  $\mu\text{S/cm}$  before spiking to nearly 1000  $\mu\text{S/cm}$  again around week 30 and exhibiting a slowly decreasing trend thereafter. The minimum value was 232  $\mu\text{S/cm}$  (week 19) and the maximum was 1100  $\mu\text{S/cm}$  (week 1), with a final value of 409  $\mu\text{S/cm}$  in week 88.
- Except week 0, Fe release was consistently low and mostly below detection.
- Sulfate production declined significantly in initial weeks of testing with a pronounced lag reaching an overall test minimum of 44 mg/kg (100 mg/L) in week 19, followed by an accelerated release of sulfate between weeks 20 and 28. The rate of sulfate release returned to that of the pre-week 20 time frame after week 79. Maximum sulfate release (374 mg/kg, 600 mg/L) was observed in week 0 and the final sulfate was 65 mg/kg (130 mg/L) at week 88.
- Acidity was detected during week 0 and then was not detected again until week 48. Thereafter, acidity ranged from below detection to 2.0 mg/kg (4 mg/L) for the remainder of the test and was consistently below detection in the final weeks of testing.
- Alkalinity release was detected in all weekly extracts and ranged from 33.0 mg/kg (53 mg/L) in week 0 to a minimum of 5.49 mg/kg (12 mg/L) observed in week 20. The final alkalinity was 13.5 mg/kg (27 mg/L) in week 88.

In terms of metal production (**Figures 3-4a** and **b**, and **Appendix C**), thallium (Tl) was detected in concentrations that exceeded the MT DEQ groundwater standard in weeks 0, 1, and 2. Nickel (Ni) also exceeded the MT DEQ groundwater standard in week 0, but was not detected in most samples during testing. No other MT DEQ groundwater standards were exceeded. Note that *Ynl A* was formerly referred to as “*Ynl*” and appears with that label in laboratory results.

MMA analysis indicated that the weathered *Ynl A* contains 31.5 wt.% quartz, 25.1 wt.% muscovite, 17.6 wt.% dolomite, 10.8 wt.% pyrite, 9.8 wt.% potassium feldspar, 2.2 wt.% biotite, and 0.95 wt.% barite. Analyses of the non-weathered *Ynl A* sample generally agreed with those of weathered *Ynl A*. However, slightly altered mineralogical composition was observed, which has been attributed to sub-sampling variability and the weathering of materials over 33 weeks of column testing (time at which sample was collected from HCT).

The *Ynl A* represents a low proportion of the expected waste rock tonnage (4%). The multi-element chemical characteristics of the subsamples selected for the 2012 Decline test aligned well with the overall, site-wide population, and so additional testing was not pursued in 2015. A summary of the metal release potential of all HCTs for the Black Butte Copper Project is presented in **Table 3-6**.

### 3.2.3.1 2012 USZ - Upper Sulfide Zone (28% Waste Rock Tonnage)

The USZ is a portion of the Lower Newland dolomitic shale that contains locally massive sulfide mineralization. As a result, this waste lithotype is identified as potentially acid generating based on static test data. In spite of its strongly negative NNP and low NP:AP ratio (Section 3.1.2), this rock maintained a net alkaline pH throughout the HCT test, apart from week 0 and week 2, which had values of 5.95 and 6.44, respectively. The final pH was 7.28 after 24 weeks of leach testing. This reflects the strongly alkaline character of the host rock, despite the relatively high rate of sulfide oxidation that was consistently observed in this humidity cell test, which released 7,736 mg/kg of cumulative sulfate. During week 6, results reported for USZ appeared anomalous, with sulfate and redox values dropping suddenly, indicating an unknown procedural error, such as loss of oxygen flow to the cell. This outlier was removed from the analysis discussed below, but these data are included in **Figure 3-5** and in **Table C-1 of Appendix C**.

- Effluent pH was neutral for the majority of the test and ranged from pH 5.95 (week 0) to a maximum of 7.38 observed in week 13. The pH in week 24 was 7.28.
- Redox potential was oxidizing for the duration of the test.
- Conductivity values were high and values consistently decreased from a maximum of 2090  $\mu\text{S}/\text{cm}$  (week 1) to a minimum of 828  $\mu\text{S}/\text{cm}$  (week 19), with a final value of 980  $\mu\text{S}/\text{cm}$ .
- With the exception of week 0 (64.5 mg/kg, 102 mg/L), Fe release was consistently low and frequently below detection.
- As expected for a sulfide-bearing deposit, sulfate release was consistently higher than other materials tested, but also showed a declining trend. Values ranged from a maximum of 724.4 mg/kg (1150 mg/L, week 0) to a minimum of 165.8 mg/kg (340 mg/L) at the end of testing (week 24).
- Acidity was detected in weeks 0-2 and was subsequently below detection for the remainder of testing.
- Alkalinity was detected in all weekly extracts and remained relatively stable, around 9 mg/kg (20 mg/L). Values ranged from a maximum of 15.3 mg/kg (24 mg/L, week 0) to a minimum of 4.3 mg/kg (9 mg/L, week 2) with an average of 8.7 mg/kg (18 mg/L) and final alkalinity of 8.29 mg/kg (17 mg/L) in week 24.

In terms of metal release, concentrations of As, Pb, Ni, and Tl exceeded groundwater criteria in week zero leachate (**Figures 3-6a and b, and Table C-2 of Appendix C**). However, this is more likely a reflection of the sample preparation for placement into the leach test than of equilibrium weathering chemical reactions within the test itself. Following week 0, no groundwater criteria were exceeded.

MLA analysis showed that the USZ composite contained pyrite (45.6 weight%), with quartz (18.6 wt.%), dolomite (16.5 wt.%), muscovite (9.7 wt.%), and potassium feldspar (4.85 wt.%). While this mineral composition supports the sulfate production observed during kinetic testing, MLA did not identify any Se- or Tl-bearing minerals. This may be due to the detection limit of this instrument, which is approximately 1000-10,000 ppm or approximately 0.1 to 1% by weight depending on the element.

**Figure 3-5** shows that the rate of sulfate production was elevated and steady and, based on ABA and NAG analyses of both sulfide and carbonate, would have likely remained so for many weeks if the kinetic test had been continued. Because Tintina

chose to designate this lithotype as PAG for the 2012 Decline Management Plan, the test was not continued to a point where alkalinity was depleted and pH dropped. Recognizing that this is a volumetrically important and reactive lithology, additional samples were collected for a second HCT that is represented of the *USZ* site-wide. A summary of the metal release potential of all HCTs for the Black Butte Copper Project is presented in **Table 3-6**.

### 3.2.3.2 2015 USZ – Upper Sulfide Zone (28% Waste Rock Tonnage)

The 2015 USZ HCT was started in June 2015 and ran for 73 weeks. In contrast to the 2012 USZ HCT, which was terminated after 24 weeks, the extent of the buffering capacity of this material was tested during this extended HCT. In spite of the low ABA and NP results for the USZ, which suggested that this material would be strongly acid generating, this HCT maintained a pH above 6 for over 30 weeks of testing. Below is a summary of observed during this 73 week test.

- Except for a low value in week 0, pH remained between 5.2 and 7.1 until week 46. Subsequently, the pH became unstable, which is characteristic of a material that is running out of buffering capacity. After week 46, the pH varied widely but generally declined to a final value of 3.04 in week 73.
- Redox potential remained oxidizing, ranging from 133 mV (week 1) to 454 mV (week 70), with an average of 337 mV.
- Conductivity values was high, with a maximum of 5,360  $\mu\text{S}/\text{cm}$  (week 0), followed by stable values around 2,200  $\mu\text{S}/\text{cm}$ , and increased instability in the latter weeks of testing.
- This HCT exhibited higher weekly Fe release than any other HCTs of waste rock in the geochemical testing program. While Fe in weeks 0 and 1 appear to be relics of sample preparation, subsequent Fe production occurred and increased in the last 10 weeks of testing. Most Fe was detected as  $\text{Fe}^{3+}$ , however some  $\text{Fe}^{2+}$  was detected, especially when high Fe was measured.
- Following an initial rinse (in week 0), sulfate production remained higher than other material tested, but trended slowly downward before increasing at the end of testing. The minimum value of 650 mg/kg (1,500 mg/L) was observed in week 34 and the maximum (aside from week 0) of 1658 mg/kg (3,768 mg/L) was in week 70. The final sulfate, in week 73, was 1180 mg/kg (2,586 mg/L).
- Acidity exhibited an initial rinse in week 0, followed by consistently detected values that increased notably in the final 10 weeks. The minimum value was <0.44 mg/kg (<1 mg/L, week 3) and the maximum (except week 0) was 194 mg/kg (426 mg/L) in the last week (73) of testing.
- Alkalinity was detected in nearly all weekly extracts, except weeks 0 and 50, until week 60, after which time alkalinity was only detect once (week 67). Detected values ranged from 0.43 mg/kg (1 mg/L, week 48) to 20.3 mg/kg (46 mg /L, week 3).

Following the initial week 0 flush, the 2015 USZ HCT consistently exhibited groundwater water quality exceedances for strontium (Sr) and Tl. Additionally, the concentrations of As, beryllium (Be), Cd, and Hg exceeded ground water quality standards once or twice during weeks 0 through 2, and not thereafter. Finally, Cu, Ni, and Pb exhibited concentrations exceeding respective groundwater standards in early weeks as well as in later weeks of testing (after week 50), which is likely related to the shift in many weekly parameter noted above. A summary of metal release potential for all HCTs for the Black Butte Copper Project is presented in **Table 3-6**.

### 3.2.3.3 2012 Ynl B - Lower Newland Conglomerate and Shale (32% Waste Rock Tonnage)

The *Ynl B* is comprised of conglomerate and shale from the basal portion of the lower Newland Formation. The static parameters summarized above indicate varying levels of acid and neutralizing potential for the samples included in this material. This variability was also reflected in the 2012 Decline HCT, in which sulfide oxidation peaked in week 16 and slowly declined for the remaining weeks of the test. The pH remained strongly neutral (7.69 in week 62), despite the cumulative release of 5,291 mg/kg of sulfate by week 62. Also, an abundance of alkalinity was observed despite increased sulfide oxidation between weeks 10 and 20 (**Figure 3-9**, and **Table C-1**).

- Effluent pH was alkaline for the duration of the test and ranged from 8.66 in week 0 to a minimum pH of 7.27 in week 54, and a final value of 7.69 in week 62.
- Redox potential was oxidizing for the duration of testing and ranged from a minimum of 20 mV (week 57) to a maximum of 335 mV (week 40). The Test average was 200 mV.
- Conductivity was initially low, but exhibited a marked increase around week 10, after which it had a steadily decreasing trend. Values ranged from 120  $\mu\text{S}/\text{cm}$  (week 6) to 690  $\mu\text{S}/\text{cm}$  (week 17).
- Iron release was consistently low and was predominantly below detection.
- Sulfate production was low until week 10, after which it rose to a peak in week 16 (173.9 mg/kg; 350 mg/L) and subsequently decreased, reaching steady state concentrations around week 32 with a final sulfate release value of 57.0 mg/kg (120 mg/L). Sulfate ranged from 10.5 mg/kg (20 mg/L, week 0) to 173.9 mg/kg (350 mg/L, week 16).
- Acidity was not detected in any weeks.
- Alkalinity was detected in all weekly extracts and with a generally stable trend ranging from 8.1 mg/kg (19 mg/L, week 42) to 24.1 mg/kg (47 mg/L, week 54), and an average of 13.5 mg/kg (28 mg/L). The final alkalinity was 13.3 mg/kg (28 mg/L).

The *Ynl B* exhibited very limited release of metals (**Figures 3-10a** and **b**, and **Table C-2**). Only antimony (Sb) exceeded its respective MT DEQ groundwater standard in week 0, which is likely a relic of sample preparation, and no other MT DEQ groundwater standards were exceeded in any weekly extract. Enviromin continued the 2012 *Ynl B* kinetic test until solute release of sulfate and a neutral pH stabilized and the results suggest that the leaching exposed and oxidized sulfide mineralization, but the available alkalinity neutralized any produced acid. This column was taken off line with MT DEQ approval after week 62.

MLA analysis indicated that the *Ynl B* composite was comprised of 41.5 wt.% quartz, 29.0 wt.% dolomite, 19.6 wt.% muscovite, 3.9 wt.% potassium feldspar, and 1.6% pyrite. These results are consistent with the low levels of sulfate and metal release observed during kinetic testing.

During the 2015 review of previous geochemical test results, Tintina and Enviromin agreed that additional samples of *Ynl B* were needed to characterize this lithotype relative to the underground workings, and a second HCT of the *Ynl B* was initiated as described below. A summary of metal release potential for all HCTs for the Black Butte Copper Project is presented in **Table 3-6**.

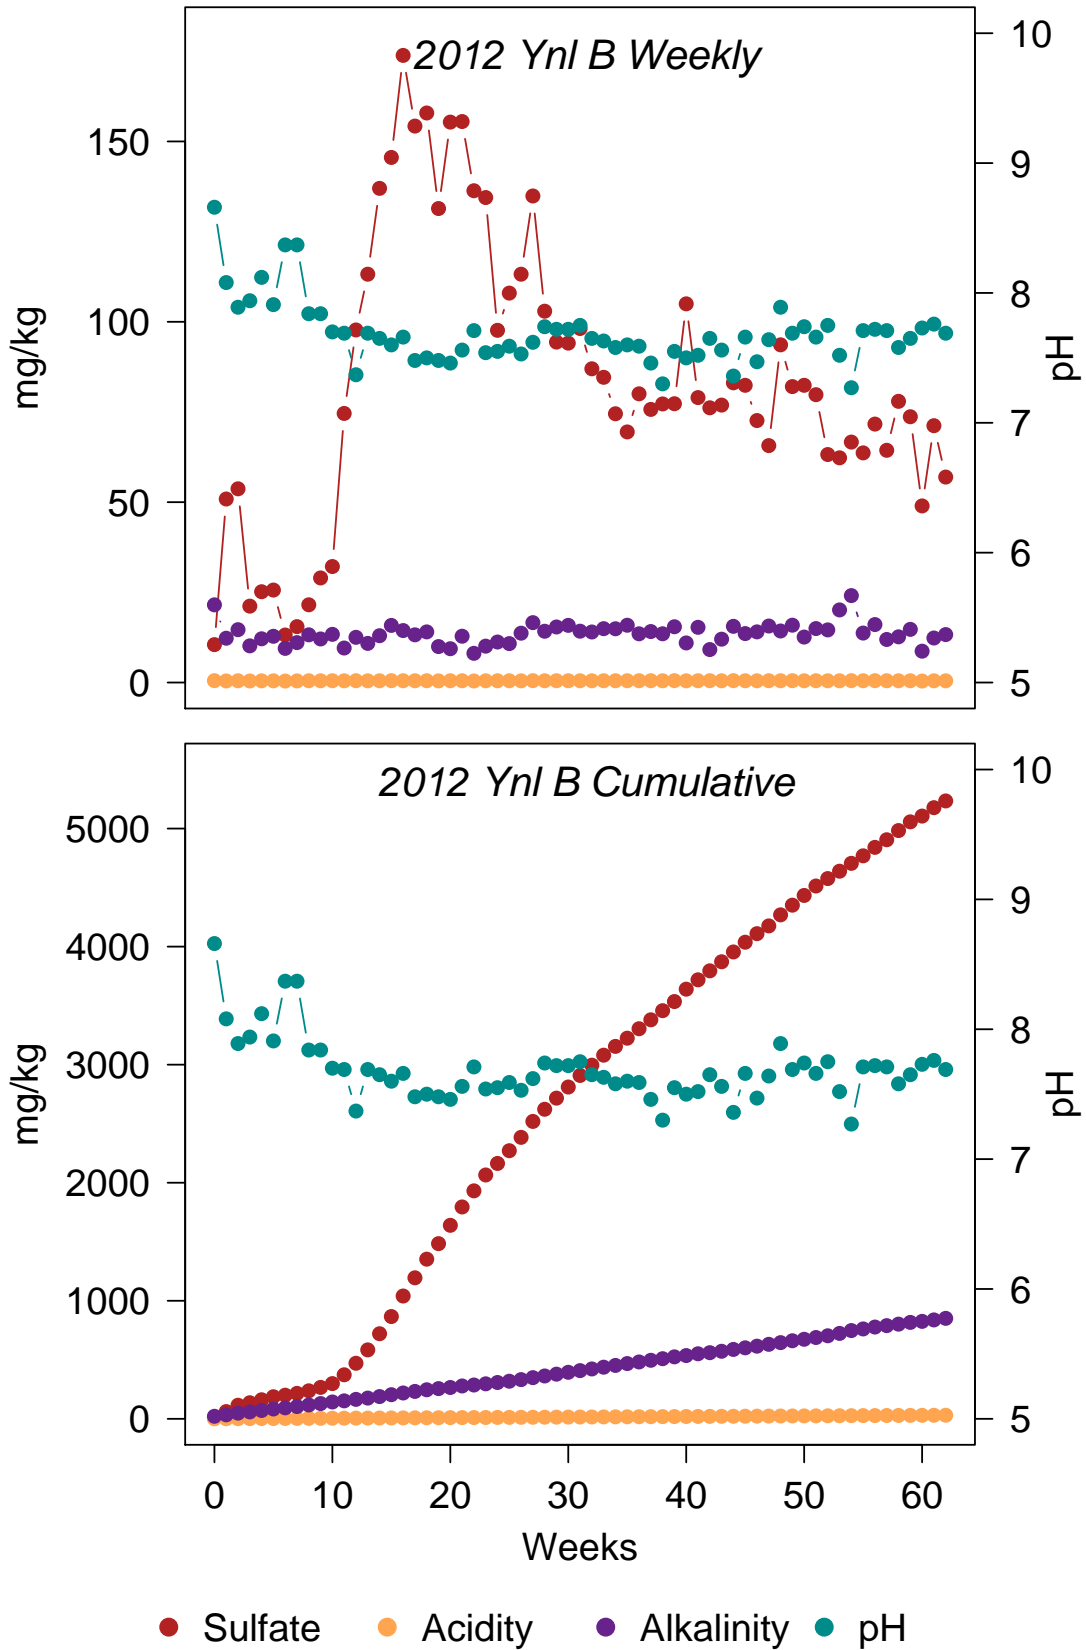

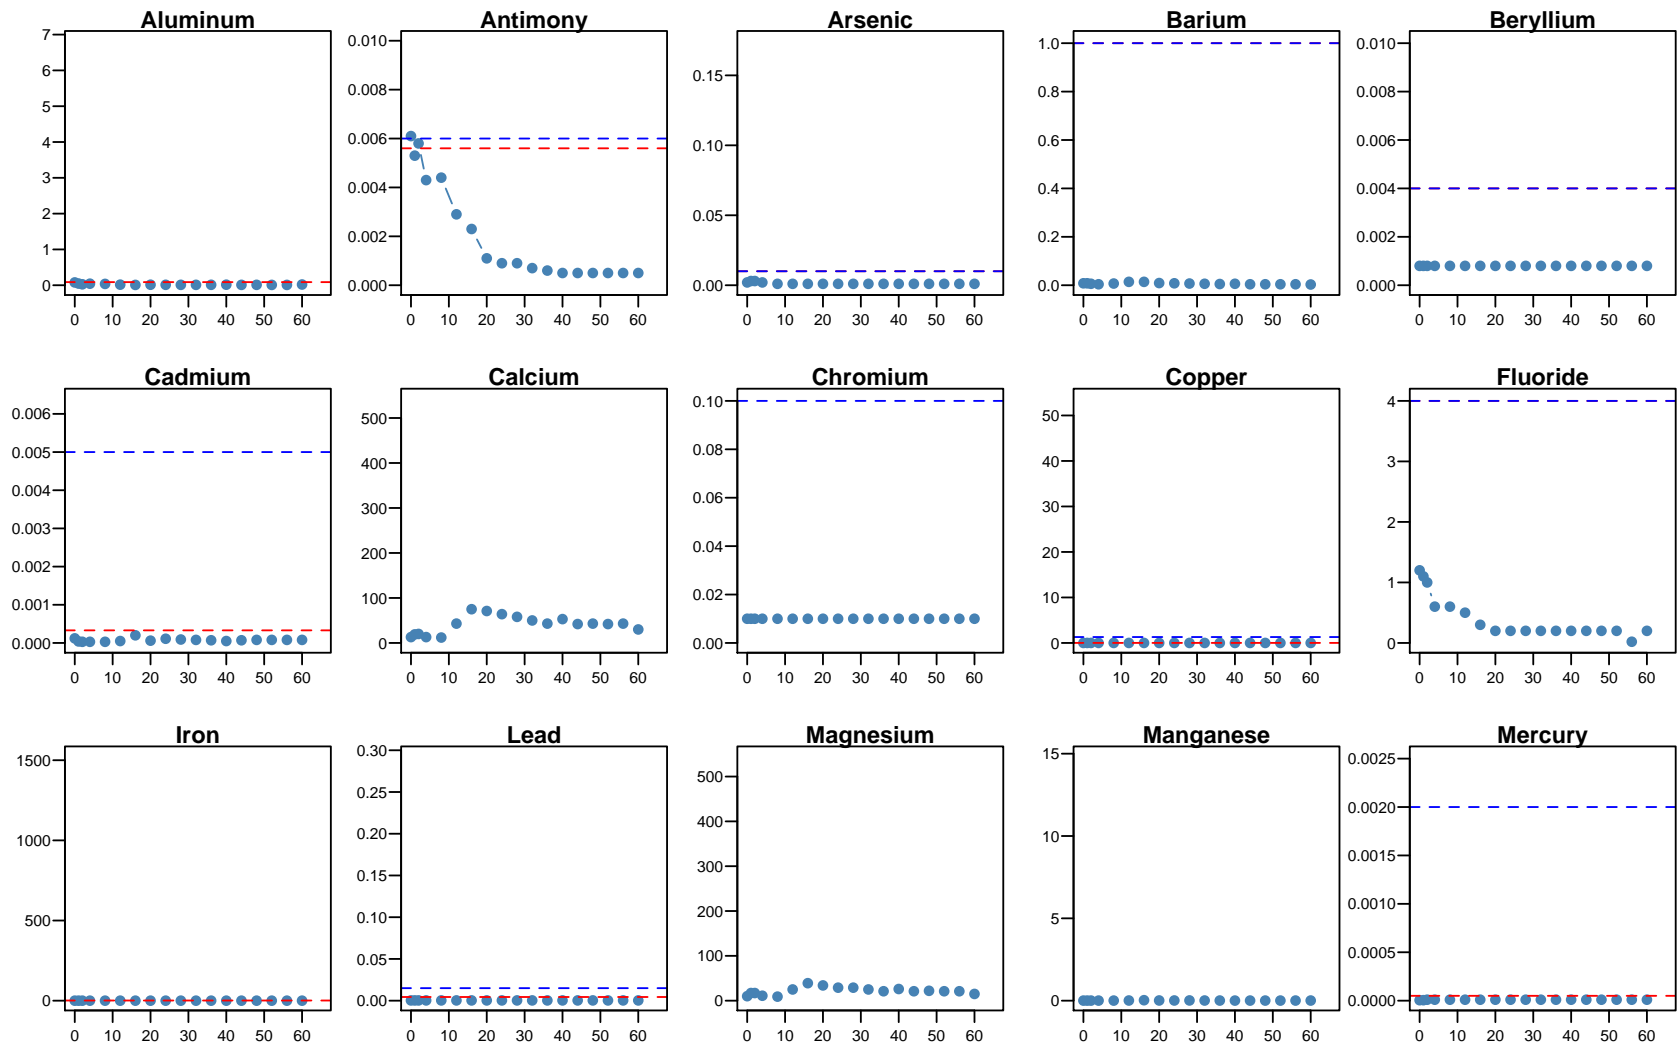

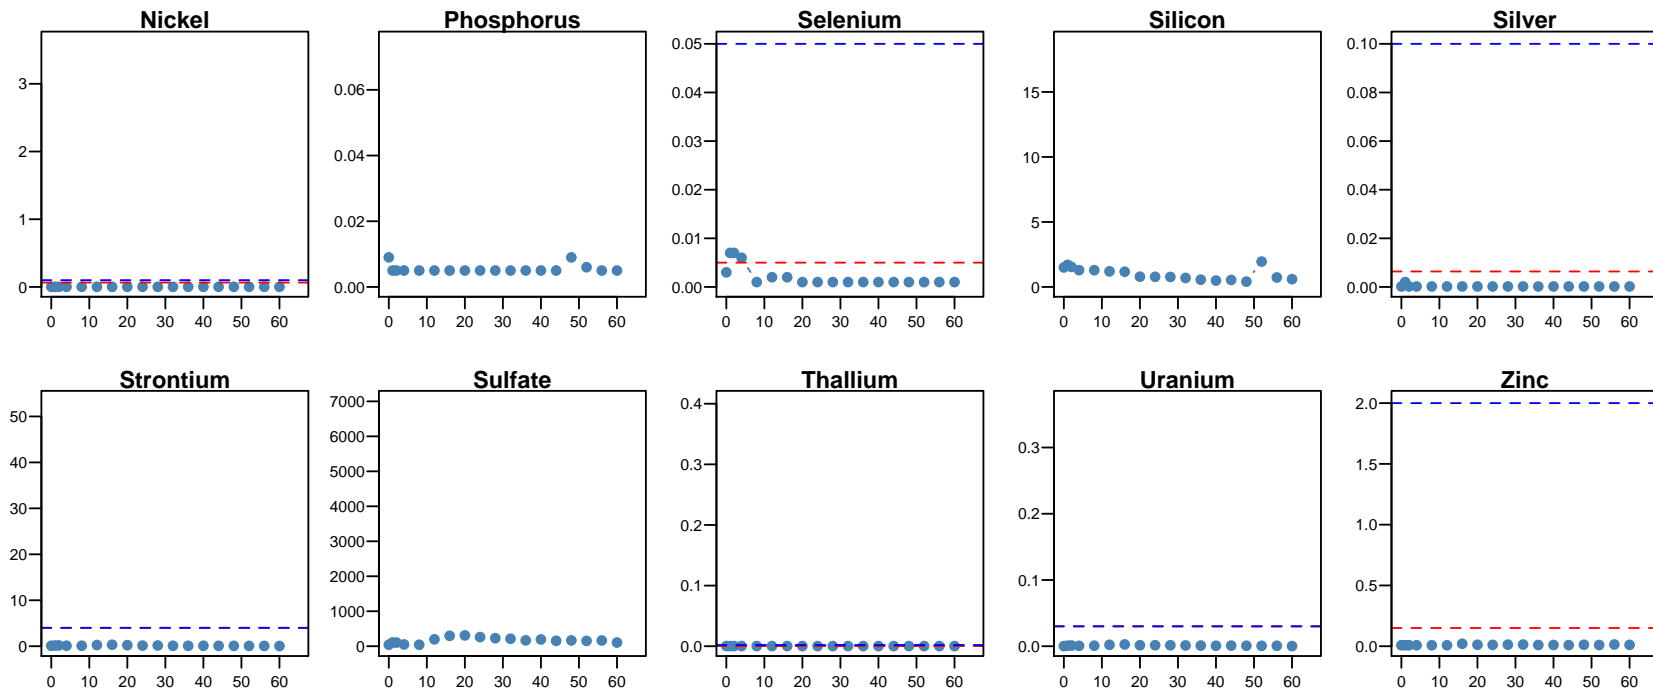

FIGURE 3-9. 2012 Ynl B HCT Weekly and Cumulative Parameters

#### 3.2.3.4 2015 Ynl B – Lower Newland Conglomerate and Shale (32% Waste Rock Tonnage)

The Ynl B material used to construct the 2015 Ynl B HCT included operationally relevant zones samples of this unit. Interestingly, the initial test results showed that the 2015 Ynl B HCT was producing pH, sulfate, acidity, and alkalinity values comparable to those in the early weeks of the 2012 Ynl B HCT. One exception to this is that sulfate production increased, peaked, and dropped off earlier in this test. The 2015 Ynl B HCT ran for a total of 36 weeks (**Figure 3-11**, and **Table C-3**).

- The effluent pH remained steady and neutral for the entire test period. A maximum pH of 7.86 was observed in in week 3 and a minimum of 7.16 was exhibited in week 33. The average pH for the duration of testing was 7.40.
- Redox potential remained oxidizing and stable for the duration of the testing ranging from 107 mV in week 31 to 382 mV in week 35, and had an overall test average of 278 mV.
- Conductivity varied greatly during the first half of testing peaking at 1723  $\mu\text{S}/\text{cm}$  in week 7, but then steadily decreasing and stabilizing around 300  $\mu\text{S}/\text{cm}$  for the remainder of testing.
- Iron release was below detection in all weekly extracts except for trace amounts detected in weeks 19 and 31.
- Sulfate production followed a similar trend to other HCTs of related material with an initial rinsing, lag period, and spike followed by continuous decrease to stable release. In this HCT the oxidation peak (post-rinsing) was observed in week 6, (411 mg/kg, 1016 mg/L) followed by a steady decrease in sulfate production with late sulfate release values between 45 and 65 mg/kg (110 and 140 mg/L; minimum observed value was 40.1 mg/kg (99 mg/L) in week 32).
- Acidity was only detected in weeks 30 and 31.
- Alkalinity was detected in all weekly extracts, ranging from 74.3 mg/kg (90 mg/L, week 0) to 7.3 mg/kg (18 mg/L, week 6), and averaging 14.1 mg/kg (31 mg/L).

The metal release signature of the 2015 Ynl B HCT differed from that of the 2012 Ynl B HCT. TI was the sole metal detected in excess of its relevant ground quality standard, which only occurred in week 0. A summary of metal release potential for all HCTs for the Black Butte Copper Project is presented in **Table 3-6**.

### 3.2.3.5 2015 LZ FW – Lower Zone Footwall (35% Waste Rock Tonnage)

The 2015 LZ FW HCT was constructed from 18 subsamples representative of the operational exposure of this rock in the workings. This HCT ran for a total of 56 weeks and data are presented in **Figure 3-13** and **Table C-3**:

- Effluent pH was consistently neutral throughout testing and demonstrated a relatively stable trend. A maximum pH was observed in week 54 (7.83), and 7.00 was the minimum in week 33. Average pH throughout testing was 7.37.
- Redox potential remained oxidizing and relatively stable throughout testing.
- After an initial period of high conductivity, values dropped, trending from 1,094  $\mu\text{S}/\text{cm}$  (week 0) to lower and more stable values between (approximately) 200-250  $\mu\text{S}/\text{cm}$  for the duration of testing.
- Fe was detected in trace concentrations in weeks 31, 41, and 43, and was otherwise not detected.
- Sulfate production exhibited a steady decline until week 33, at which time it increased modestly. Sulfate ranged from a high of 352 mg/kg (450 mg/L, week 0) to a minimum of 25.3 mg/kg (52 mg/L, week 21). At the conclusion of testing, sulfate release had decreased and stabilized at approximately 25-35 mg/kg (60-70 mg/L).
- Acidity was only detected in weeks 30 and 31 (3.6 and 2.3 mg/kg (8 and 5 mg/L), respectively), and was not otherwise detected.
- Alkalinity was detected in all weekly extracts, ranging from a low of 4.55 mg/kg (9 mg/L) observed in week 52, to 47.6 mg/kg (61 mg/L, week 0). Aside from these extreme values, the alkalinity was relatively stable with an overall test average of 11.7 mg/kg (25 mg/L). The final alkalinity was release was 7.28 mg/kg (17 mg/L).

The metal release signature for this material indicates its diverse mineralogy. Consistent release of As and uranium (U), and well as repeated early release of Sb in excess of respective ground water quality standards was observed, which is distinct from other lithotypes at the Black Butte Copper Project. A summary of metal release potential for all HCTs for the Black Butte Copper Project is presented in **Table 3-6**.

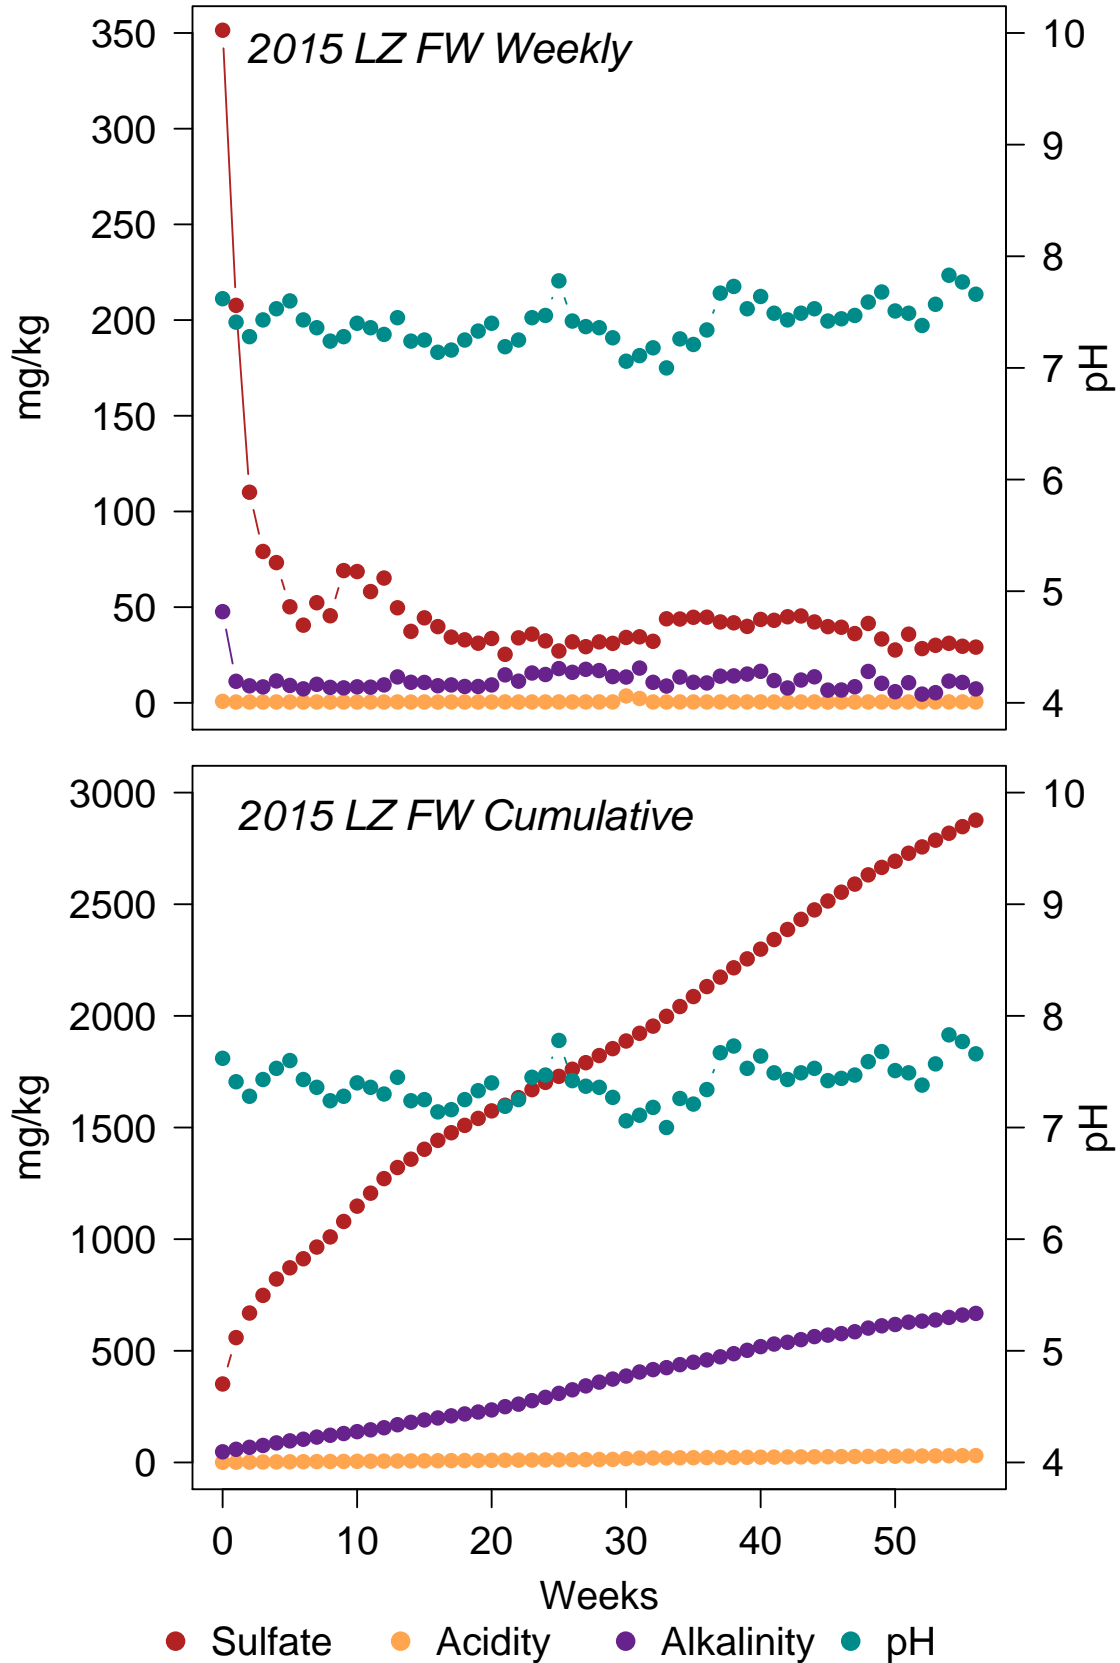

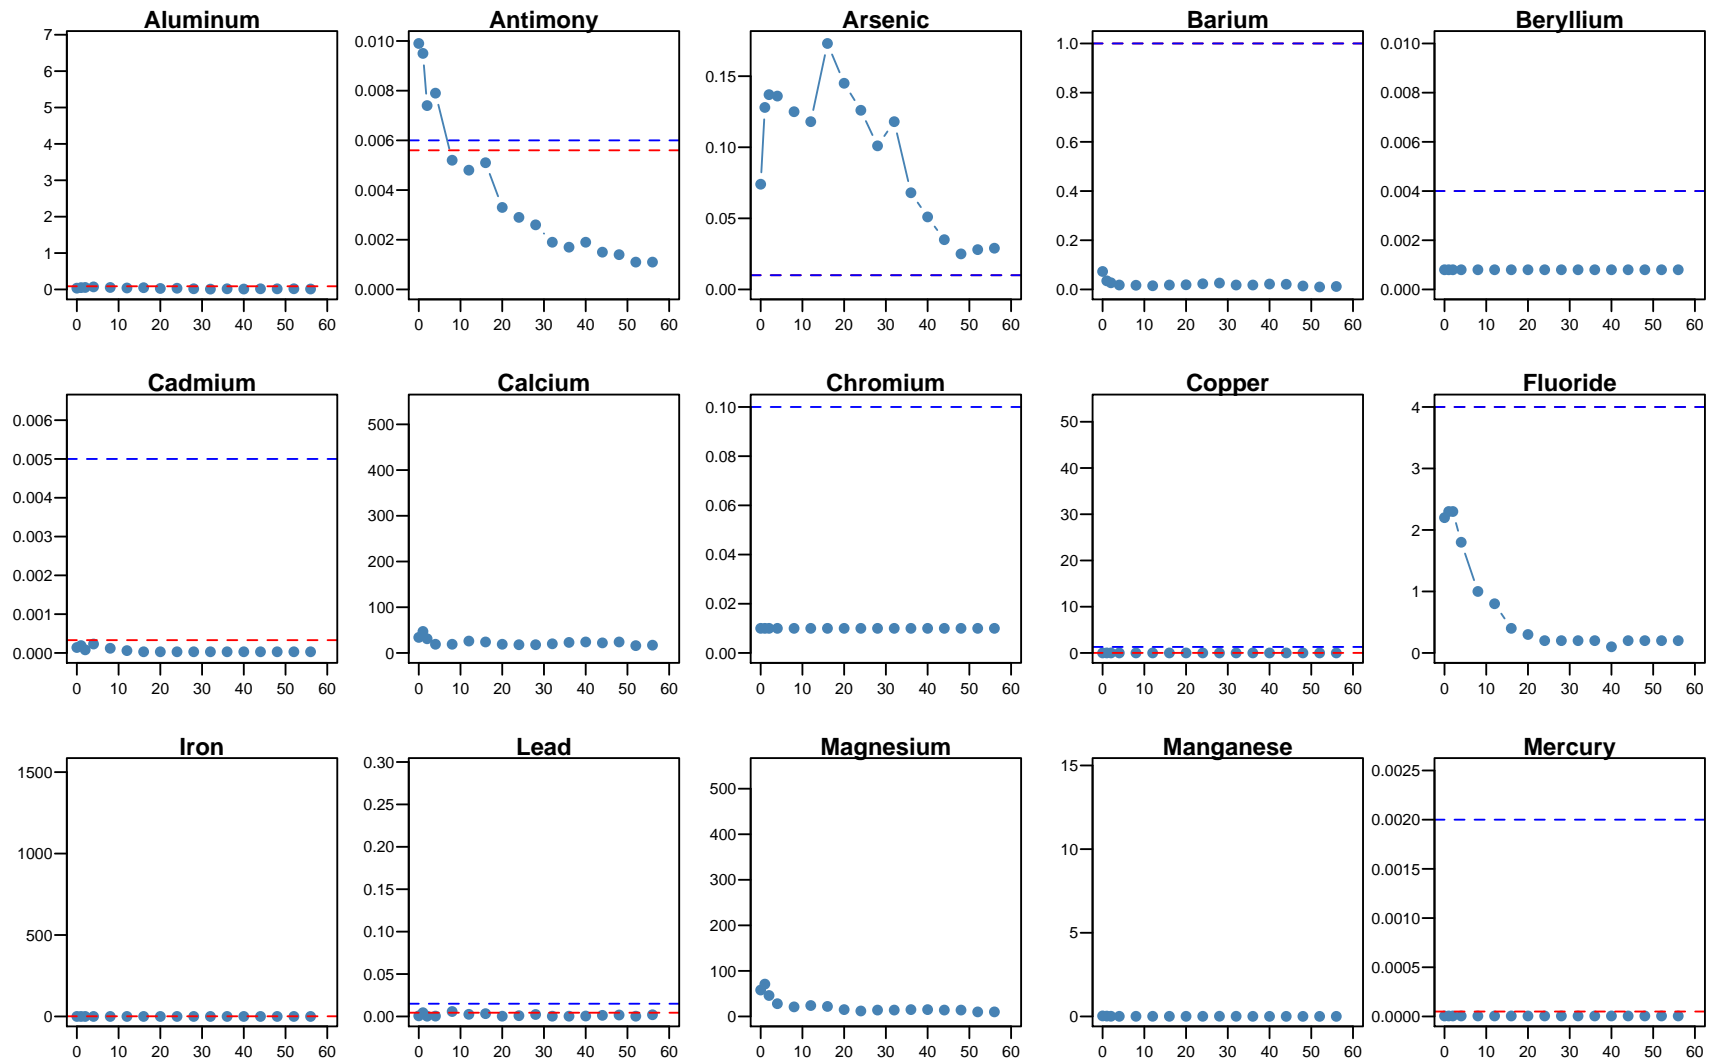

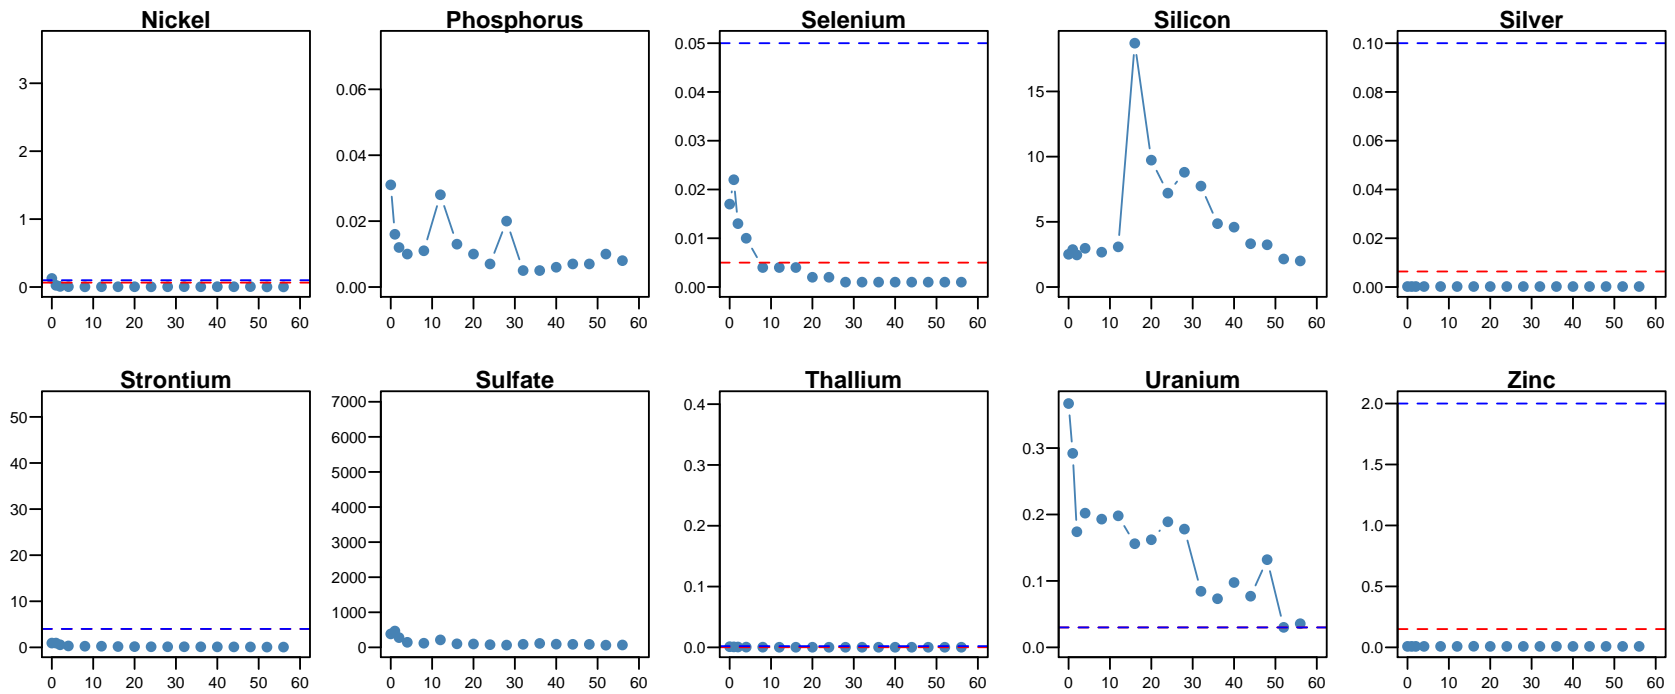

FIGURE 3-13. 2015 LZ FW HCT Weekly and Cumulative Parameters

### 3.2.3.6 2012 Ynl 0 - Dolomite “Nose” Lower Newland Formation (<1% Waste Rock Tonnage)

The Ynl 0 is a dolomitic interbed within the upper part of the lower Newland Formation. This unit serves as a marker that defines the transition to the lower Newland Formation, and while it represented 6% of the tonnage from the 2012 Decline, it represents less than 1% of the operational scale waste rock tonnage. It contains very little sulfide and is strongly alkaline (**Figure 3-15**). During kinetic humidity cell testing, it exhibited very low potential for metal-release (**Figures 3-16a and b** and **Table C-2** of **Appendix C**), no MT DEQ groundwater exceedances were observed during kinetic testing.

- Effluent pH was alkaline for the duration of the test trending from 9.19 in week 0 to 7.74 in week 24, with a minimum pH observed in week 17 (7.46).
- Redox potential was oxidizing for the duration of the test and ranged from 7 mV (week 0) to a maximum of 197 mV (week 17), with a final redox of 182 mV in week 24.
- Conductivity values were low and ranged from 240  $\mu\text{S}/\text{cm}$  (week 1) to 62  $\mu\text{S}/\text{cm}$  (week 17) with a final value of 72  $\mu\text{S}/\text{cm}$  (week 24).
- Iron was consistently low and was below detection in most weeks.
- Sulfate release was also consistently low, ranging from an initial “rinse” of 33.9 mg/kg (78 mg/L) in week 1 to a final and minimum release of 3.5 mg/kg (7 mg/L) in week 24.
- Acidity was not detected in any weeks.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 28.0 mg/kg (42 mg/L, week 0) to 7.6 mg/kg (16 mg/L, week 17), but were regularly stable, ending with 9.9 mg/kg (20 mg/L) in week 24.

With 24 weeks of kinetic testing showing consistently low rates of sulfate production and metal release. No MT DEQ groundwater standards were exceeded during this HCT.

Mineralogical analysis of the Ynl 0 material agreed with the static and kinetic test results and indicated that this material is comprised largely of dolomite (74.5 wt.%) with 18.7 wt.% quartz, 3.8 wt.% muscovite, and 1.0 wt.% potassium feldspar. One Ynl 0 sample had static ABA/NAG results, suggesting that sulfide mineralization can occur locally. During kinetic testing, Se and TI were detected at concentrations greater than the relevant standards, but the MLA method was not successful in identifying Se- and TI-bearing minerals. These findings agree with the previously reported mineralogy of this portion of the Lower Newland Formation. Certainly, the absence of sulfide mineralization agrees with the very low observed rates of sulfate release.

The Ynl 0 unit was sufficiently well characterized in the 2012 tests and no further testing was conducted in 2015. A summary of metal release potential for all HCTs for the Black Butte Copper Project is presented in **Table 3-6**.

### 3.2.3.7 2015 Yc – Chamberlain Shale (<1% Waste Rock Tonnage)

Although the current mine design does not include development of the Yc lithotype, earlier versions of the Black Butte Copper Project mine design had incorporated it, and it is possible that this unit could be encountered at depth if mine plans change in the future. It was included in the geochemical testing program for this reason. As described above, this test was started in June 2015 and was terminated after 38 weeks of testing. Below is a summary of observed chemistry.

- Effluent pH was strongly neutral to alkaline; values trended slightly downward with the maximum pH of 8.18 observed in week 4 and a minimum of 7.27 in week 32. The average was 7.63, and the final pH was 7.60.
- Redox potential remained oxidizing and stable, with values ranging from 222 mV (week 0) to 396 mV (week 11), and an average of 309 mV.
- Initially high conductivity values dropped to stable low values ranging from 450  $\mu\text{S}/\text{cm}$  (week 0) to 126  $\mu\text{S}/\text{cm}$  (week 38).
- Iron release was only detected in weeks 4, 7, 10 and 32, and was comprised primarily of  $\text{Fe}^{3+}$ .
- After an initial flush, sulfate production declined and generally stabilized. Sulfate release ranged from 107 mg/kg (130 mg/L, week 0) to 8.9 mg/kg (19 mg/L, week 33), and average release was 19.6 mg/kg (41 mg/L).
- Acidity was not detected in any effluent.
- Alkalinity was detected in all weekly samples, and release ranged from a minimum of 14.5 mg/kg (36 mg/L, week 4) to a maximum of 73.2 mg/kg (89 mg/L, week 0). Average alkalinity release was 23.2 mg/kg (49 mg/L).

Metal production during the Yc HCT indicated a potentially high rate of As release: all weekly extracts analyzed for metals demonstrated As levels in excess of the MT DEQ groundwater water quality standard. No other metals exceeded respective MT DEQ groundwater standards. A summary of metal release potential of all HCTs for the Black Butte Copper Project is presented in **Table 3-6**.

### 3.2.4 Summary of all Waste Rock HCT data

All eight HCTs of waste rock material were terminated once steady state solute release was established and in consultation with the MT DEQ. **Table 3-6** provides a summary of metal mobility observed in each of the eight HCTs.

**TABLE 3-6. Metals Exceedances in 2012 and 2015 HCTs**

Humidity Cell Name	Weeks of testing	Final pH (s.u.)	Constituents above MT DEQ Groundwater Standards, based on 2012 DEQ-7 <sup>1</sup>
2012 Ynl A	88	7.36	Ni, Tl
2012 USZ	24	7.28	Pb, Ni, Tl
2015 USZ	73	3.04	<i>As, Be, Cd, Cu, Pb, Hg, Ni, Sr, Tl</i>
2012 Ynl B	56	7.69	Sb
2015 Ynl B	36	7.53	Tl
2015 LZ FW	56	7.49	<b>As, Sb, Ni, U</b>
2012 Ynl O	24	7.74	None
2015 Yc	38	7.60	As

## 4 Tailings Characterization

Geochemical testing of the tailings for the Black Butte Copper Project has addressed various scenarios for tailings storage and disposal. A homogeneous and representative tailings composite was created during metallurgical testing for use in all environmental geochemistry tests. Testing was focused on Tintina's proposed placement of tailings as a cemented paste, both underground as backfill and in the CTF. Both raw (non-amended) and cemented paste tailings were thus assessed under subaqueous and sub-aerial weathering conditions in laboratory tests. A summary of how tests of these materials relate to Tintina's proposed actions, as well as foreseeable alternatives, is presented in **Table 1-3**.

### 4.1 Paste Tailings

Varying proportions of binding agents have been added to the raw tailings to produce cemented pastes for backfill or surface placement. A combination of 50% cement and 50% slag was used as the binding material. Four percent (by weight) was added to simulate paste backfill and 2 wt. % was added to evaluate cement paste tailings placed in the surface impoundment. A supplemental test of paste tailings with 10% run-of-mine (ROM) waste rock fully mixed into the cemented paste was also included in the geochemical testing program to simulate proposed co-disposal of the tailings and waste rock. The ROM was created using the following proportions of waste rock: *USZ*: 34%, *LZ FW*: 32%, *Ynl B*: 17%, *Yc*: 10%, and *Ynl A*: 5%; it was evenly distributed through the paste amended tailings. These proportions reflect the estimated proportions of waste rock available *at the time* the ROM composite was constructed and differ somewhat from the final proportions of waste rock units described in **Table 1-1**. The geochemical tests conducted on the different paste tailings scenarios are summarized in **Table 1-2**.

#### 4.1.1 Static Testing

Replicate paste samples with 2 and 4% binder were subjected to multi-element whole rock analysis using inductively coupled plasma-atomic emission spectroscopy (ICP-AES) following a 4-acid digestion with a mixture of perchloric, nitric, hydrofluoric, and hydrochloric acids. ABA and NAG analyses were also completed as described above. Results of the static testing of paste tailings are presented in **Tables 4-1** and **4-2** and respective lab reports are found in **Appendix D**.

The results of static testing of paste tailings demonstrate that the 4% cemented paste was very similar to the 2% cemented paste in metal and sulfide content. Although the NP was higher in the 4% cemented paste, the NNP, NP/AP ratio, and final NAG pH are comparable between the two cement paste treatments and suggest potential for acid production.

#### 4.1.2 Diffusion Testing

ASTM method C1308 (diffusion testing) was used to evaluate the oxidation and leaching potential of the cement paste tailings in saturated environments. This method has been approved by the state of Nevada, where certain labs are now state-certified to perform ASTM C1308 to characterize solute release from backfilled paste tailings (Moran *et al.*, 2013).

The method involves submersion of a solid cylinder (2:1 height to diameter ratio) in a solution with a volume equal to 10 times the surface area of the cylinder. Deionized water was used to simulate meteoric water, and because it allowed comparison with the effluent in other HCT tests, this water was replaced periodically over an 11-day period. Specifically, the solution was replaced at 2 hrs, 7 hrs, and 24 hrs, and then every 24 hrs until the 11-day test was complete.

Tintina contracted WETLab, of Sparks, NV (a Nevada-certified lab) to conduct diffusion tests for the 2%, 4% and 4% with ROM amended tailings. Unfortunately, due to the small size and high relative surface area of the cylinders, the 2% paste-amended cylinder disaggregated when saturated in the diffusion test and was terminated before the first sample could be collected (<2 hours). Results of the 4% and 4% with ROM amended tailings diffusion tests are thus presented, along with HCT data (described below) in **Figures 4-1 through 4-7** and **Appendix D, Tables D1a-b**, and indicate the reactivity of the amended paste material under saturated conditions over time. These results are relevant to the prediction of the geochemistry of amended paste tailings when placed as backfill.

#### 4.1.3 Kinetic HCTs

In addition to assessing the acid production and metal release potential of paste tailings under saturated conditions, modified HCTs of the paste tailings cylinders were also used to evaluate subaerial weathering. These aerated tests better represent the effects of the cyclic oxidation and intermittent wetting conditions anticipated to occur in the surface storage facility. The procedure for these tests is identical to the ASTM method for kinetic humidity cell testing, except that the solid material loaded into the column was not crushed. The pasted tailing was added as an intact cylinder. Due to the small cylinder size of the 4% with ROM (2 in wide: 4 in high), the minimum 1 kg requirement for sample mass described in the ASTM procedure was not met. Additionally, the volume of effluent was modified to accommodate submersion of the cylinder. This adjustment is not, strictly

speaking, an alteration in ASTM protocol, as it falls within the range of testing options for the method.

Cylinders containing 2%, 4% and 4% with ROM amended tailings were tested using this modified HCT method, as presented above in **Table 1-2**. These tests were terminated after 28, 28, and 24 weeks of testing, respectively. Results are presented in **Figures 4-1 through 4-7** and **Appendix D, Tables D-2 and D-3**.

Red shading indicates that based on the ratings systems presented in Tables 3-1 and 3-2 of Appendix D, these samples all have potential to generate acid.

## **4.2 Raw (Non-amended) Tailings**

The raw (non-amended) tailings material were also characterized to provide basic information about the acid generation and metal release potential of this material, as well as geochemical data for modeling of a possible dry stack storage alternative. Tintina does not plan to store or stack raw tailings material, however, and has proposed that all tailings should be placed underground as paste backfill or placed as paste in a lined and monitored cemented tailings facility.

### **4.2.1 Static Testing**

Similar to the approach used in characterization of the waste rock and paste amended tailings, whole rock metal analysis, ABA and NAG methods were used to assess the acid generation potential of the raw tailings. Results of the static testing of raw tailings indicate that this material is likely to produce acidic drainage and contains elevated levels of sulfur and metals.

### **4.2.2 Kinetic HCTs**

The raw tailings were subjected to two styles of kinetic HCT tests. One followed the ASTM standard HCT method (D5744-13) that is described above for waste rock. A second kinetic test was a modified version of the ASTM standard for HCTs, in which a constant head of water was maintained over the sample in the test column. Rock was submerged and remained under saturated and suboxic conditions until the seventh day of each weekly cycle, at which time the leachate was allowed to freely drain from the sample and fresh influent was added. In this version of the test, the typical forced-air technique was not employed, and contact with air (i.e., oxygen) was limited to 15 to 30 minutes between the draining of effluent and addition of new influent deionized water, as well as any oxygen present in the water itself. All other aspects of the testing (weekly test parameters and periodic metal analysis) were identical to ASTM standard D5744-13. These kinetic HCTs were terminated after 47 weeks of testing as described below. McClelland Laboratories' discussion of results is found in their Interim Report of Kinetic Testing (in **Appendix C** of this report)

There is a clear difference in the potential environmental impact of saturated and unsaturated tailings. Suboxic conditions, which are maintained in the saturated test using a constant head of water to limit the infiltration of oxygen, produce much lower amounts of sulfate, acidity and metals than the aerated tailing HCT. **Figures 4-1 through 4-7** clearly demonstrate these differences, which are also presented in **Appendix D, Table D-2 and D-3**.

## **4.3 Discussion of All Tailings Kinetic Results**

Acid and sulfate production varied between the paste tailings HCTs, with the 2% test exhibiting greater release than the 4% with ROM test, which was in turn greater than the 4% test. At the conclusion of testing, the cumulative and individual measurements of sulfate production were distinctly lower in the 4% HCT than in the 2% and 4% with ROM HCTs. All tests began at a pH above 6, which was maintained for 1, 2, and 4 weeks in the 2%, 4% with ROM, and 4% cylinders, respectively, but eventually, all paste HCTs dropped below a pH of 3. Groundwater metal exceedances are summarized by test in Table 4-3.

The 4% binder and 4% with ROM cylinders in the diffusion tests showed different trends in sulfide oxidation. The 4% binder cylinder maintained a variable, but overall higher, pH between 6.5 and 9.5, with available alkalinity, and produced less sulfate throughout the test than the 4% with ROM cylinder. This is likely due to the disruption of the massive cemented paste matrix by the ROM rock particles. Rates of metal release were significantly lower in diffusion tests of cemented paste tailings than in HCTs of corresponding material. Because the diffusion tests were intended to simulate underground backfill scenarios, the results have been compared to relevant groundwater standards in **Appendix D, Table D-1a and b**. Relevant As and TI groundwater standards were exceeded in the 4% binder and 4% with ROM cylinders, respectively.

The HCT results demonstrate that the paste-amended treatments have lower potential for acid, sulfate and metal release than HCTs of raw tailings. Initially, the saturated raw tailings HCT exhibited the lowest sulfate, acid and metal release, but near the conclusion of testing, many of these constituents increased in concentration. Meanwhile, the corresponding sub-aerial HCT of raw tailings exhibited the highest rates of release, with some slightly decreasing trends over time.

In terms of metal release, the 4% cemented paste HCT exceeded fewer groundwater standards than the 2% cemented paste HCT. Furthermore, the 4% cemented paste HCT began to release increasing concentrations of sulfate and metals of, e.g. Cu and Ni, in week 8, while the 2% HCT began producing high concentrations of metals sooner.

Addition of ROM into the matrix of the 4% cemented paste tailings appears to have modestly affected sulfate and acid production during the first half of the test, with the pH of the ROM-amended test approximately one unit lower than the 4% cemented paste tailings. This is likely due to the disruption of the paste cylinder matrix by rock fragments, thereby enhancing its rate of disaggregation. In the second half of the test, the rate of solute release for this HCT began to approach that observed for the 2% HCT, reflecting its disaggregation as the test proceeded. Metal release signatures of the 4% and the 4% with ROM HCTs followed similar trends, but had variable magnitudes of release. For example, groundwater exceedances in effluent from the 4% with ROM HCT were similar to those observed in the 4% paste cement HCT (**Table 4-3**).

HCT results for paste cylinder samples provide an interesting contrast to the HCTs of non-amended tailings. The unsaturated, sub-aerial HCT of non-amended tailings exhibited distinctly higher sulfide oxidation rates than all other kinetic tests of tailings, with a cumulative sulfate production of more than 200,000 mg/kg and pH consistently below 3. Conversely, anoxic conditions in the saturated HCT significantly limited acid and metal production until alkalinity was fully depleted after week 35.

Results of the non-amended tailings sample tested in the conventional, subaerial kinetic test demonstrated strong acid generation and a correspondingly high potential to generate sulfate and several metals at low pH. Effluent from this test routinely exceeded groundwater standards for Sb, As, Be, Cd, Cr, Cu, Pb, Ni, TI, and Zn (**Table 4-3 and Appendix D**)

In contrast, the saturated kinetic test showed much lower sulfide oxidation and release of metals, and maintained a circum-neutral pH for most of the test. After 30 weeks of testing, as available alkalinity began to decrease, this material also produced acidic leachate. At the lower oxidation rate in the saturated HCT, fewer metals exceeded relevant groundwater quality standards. Specifically, in nearly all weeks of testing relevant groundwater standards for As, Ni, and TI were exceeded in the saturated tailings HCT effluent, with isolated groundwater standard exceedances for Pb and Cu.

**TABLE 4-3. Exceedances in Kinetic Tests of Paste and Non-Amended Tailings**

Test Name	Weeks of testing	Final pH (s.u.)	Constituents above MT DEQ Groundwater Standards, based on 2012 DEQ-7 <sup>1</sup>
4% Diffusion	11 days	7.15	As
4%+ROM Diffusion	11 days	6.79	Tl
4% HCT	28	2.67	As, Be, Cr, <b>Cu, Ni, Tl</b>
2% HCT	28	2.87	Sb, <b>As, Be, Cr, Cu, F, Ni, Tl, U, Zn</b>
4%+ROM HCT	24	2.67	Sb, As, Be, Cr, <b>Cu, Pb, Ni, Tl</b>

## 5 Conclusions and Recommendations

The acid generation and metal release potential of waste rock and tailings to be produced by Tintina's proposed Black Butte Copper Project have been characterized using static multi-element analysis, acid-base accounting, net acid generation potential, and kinetic methods. Mineralogical analyses of metal residence and asbestiform mineral analyses were also completed.

The testing program has addressed all proposed management plans and anticipated alternatives. Static and kinetic tests of all waste rock with tonnage >1% included in the total life of mine plan (totaling 778,810 tons or 706,525 tonnes) as stated in the MOP Application have been completed, and additional waste lithotypes representing tonnages <1% (including *IG*, *Ynl 0*, *Yne*, and *Yc*) have also been characterized. Raw (non-amended) tailings were tested along with cemented paste tailings with 2% and 4% cement binder, and 4% cement binder mixed with run-of-mine rock to simulate alternative disposal methods. Tailings have been tested under both subaerial weathering and saturated conditions. Predictive models of water quality for the underground workings during operations and at closure, for the waste rock stockpile, and for the cement tailings facility are reported elsewhere (Enviromin 2017c). Additionally, geochemical characterization of near-surface rock has been conducted and is reported separately (Enviromin, 2017b).

### 5.1 Waste Rock Geochemistry.

Waste rock from the life of mine underground mine plan is associated with the following units (in decreasing order of abundance): Lower-Zone Footwall (*LZ FW*, 35% of waste rock tonnage), the Lower Newland basal shale and conglomerate (*Ynl B*, 32%), the Upper Sulfide Zone (*USZ*, 28%), and the Undifferentiated Lower Newland (*Ynl A*, 4%). A total of 7,497 whole rock samples of waste rock, including 5,642 samples of the four dominant waste rock lithotypes, were statistically analyzed to characterize overall geochemical variability within multiple lithotypes and to identify representative sample subsets for static and kinetic testing. No asbestiform minerals were identified in any lithotype to be mined from the Project. A total of 138 static tests of acid generation potential, using both acid-base accounting (ABA) and net acid generation (NAG) methods, were completed by ALS Laboratories (Sparks NV) for the dominant waste rock lithotypes. Results of ABA and NAG tests indicate that the majority (90%) of *Ynl B* and *Ynl A* samples are unlikely to form acid, while many *USZ* and *LZ FW* samples have an uncertain potential or have the potential to generate acid.

Kinetic tests of *Ynl B*, *USZ*, and *Ynl A* waste rock collected from the vicinity of the previously proposed 2012 Decline were completed by McClelland Laboratories (Sparks NV) following the ASTM protocol D5744 in 2012. The *Ynl A* composite tested in 2012 was comprised of subsamples that were representative of this lithotype site wide, but the *Ynl B* and *USZ* composites were not. To address this limitation, additional tests of these two waste rock lithotypes were initiated in 2015 using representative subsamples collected site wide. Also, as a result of updates in the mine plan, the *LZ FW* was identified as a significant portion of the waste rock tonnage to be produced; representative samples were therefore identified, analyzed and composited for kinetic testing of this unit as well. The 2015 *Ynl B*, *LZ FW*, and *USZ HCTs* were terminated in consultation with MT DEQ after 36, 56, and 73 weeks of testing, respectively.

Sulfide oxidation was observed in HCTs for the four dominant waste rock units. However, consistent with static test results and the presence of abundant carbonate mineralization, oxidation in the *Ynl B*, *Ynl A*, and *LZ FW* tests did not produce sufficient acidity to deplete alkalinity, nor did these tests produce acidic pH values. Despite indications of sulfide oxidation, depleted alkalinity and increased acidity with somewhat lower pH was observed solely in the 2015 *USZ* test. While static tests suggest that the *USZ* unit is likely acidic, the 2015 kinetic test of this material demonstrated its strong buffering capacity: despite consistently high sulfate release, this HCT did not become acidic until week 60.

All assessments of metal release potential for waste rock lithotypes (tonnage >1%) and tailings were based on metal concentrations measured in kinetic test effluents in weeks 0, 1, 2, 4, and every 4 weeks thereafter. The data allow assessment of potential impacts by individual rock type, but overall water quality should be considered based on facility scale predictions provided by Enviromin (2017c)

The *Ynl B* and *Ynl A* units maintained neutral pH in the test cells and did not exceed groundwater standards after week 2. Subsequent to rinsing observed in week 0 in the 2012 *USZ* HCT, only TI exceeded its respective groundwater standard. In contrast to low metal release in the 2012 *USZ* HCT, the 2015 *USZ* HCT exhibited repeated groundwater standard exceedances for As, Be, Cd, Cu, Pb, and Ni, while groundwater exceedances were also observed for Hg in weeks 1 and 2, and Sr and TI in all weeks. The *LZ FW* lithotype exhibited repeated exceedances of the Sb groundwater standard in early weeks and As, and U exceeded respective groundwater quality standards in all weeks. Because each of the waste rock lithotypes has some, if variably significant, potential to generate acid or release concentrations of metals exceeding water quality standards, Tintina proposes to encapsulate waste rock in cemented paste tailings within the lined and monitored CTF impoundment. Further, Tintina proposes to collect all water from the waste rock stockpile, the CTF, and the underground workings for treatment to meet non-degradation standards prior to discharge into underground infiltration galleries. Potential for waste rock drainage impact to surface and groundwater is therefore low.

Mineralogical analyses, using the Mineral Liberation Analysis/Scanning Electron Microscopy method, were completed for samples of waste rock post-weathering to evaluate the mineral residence of metals detected in HCT effluent, such as TI and Se. No discrete mineral phases containing TI or Se were identified, but analysis of the TI and Se content of heavy liquid separates (which separated the light feldspars from the heavy sulfides) suggested that these elements occur as trace substitutes in the sulfides.

## 5.2 Tailings Geochemistry

Splits of homogenized tailings reject produced in bench-scale metallurgical testing were used for all tests. There is minor variation in AP and NP, but the ABA and NAG tests indicate that the tailings will have a strong potential to generate acid with or without paste amendment. Although the neutralization potential resulting from the addition of 2 to 4% cement binder is not sufficient to neutralize the sulfide in the tailings, this was not the intent of binder addition. The binders will be added to provide structural strength in support of drift and fill mining methods underground, and to change the physical properties of the tailings to a stable, non-flowable material with low hydraulic conductivities on the order of  $10^{-8}$  cm/sec in both surface and underground settings.

Cemented paste tailing cylinders were tested (without crushing) in conventional ASTM method D5744 humidity test cells, to simulate sub-aerial weathering, and in ASTM

C1308 diffusion tests, to simulate diffusion through backfill in saturated underground workings. Raw (non-amended) tailings were tested using ASTM method D5744, both sub-aerially and in a modified, saturated ASTM method D5744 test, to represent the alternative scenarios of dry stack surface placement and subaqueous deposition impoundment, respectively.

The 4% binder and 4% with ROM cylinders showed different trends in sulfide oxidation in the diffusion tests. The 4% binder cylinder maintained a variable, but overall higher, pH between 6.6 and 9.7, with available alkalinity and less sulfate throughout the test than the 4% with ROM cylinder, in which pH ranged from 5.5 to 6.8. This suggests that the massive cemented paste tailings, in which the matrix is not interrupted by rock fragments, may be important in controlling sulfide exposure for oxidation. Rates of metal release were significantly lower in diffusion tests of saturated cement paste tailings than in unsaturated HCTs of cemented paste tailings. In fact, groundwater standards were only exceeded for As and TI in the 4% binder and 4% with ROM cylinders, respectively. Furthermore, because the backfilled paste tailings have very low transmissivity they will react slowly with groundwater and are unlikely to create acidity or release concentrations of metals above groundwater standards. The influence of this low reactivity on water quality in the underground workings is modeled and reported separately (Enviromin 2017c).

Conventional, aerated HCTs of paste tailings were used to evaluate behavior of the paste tailings in surface deposits within the CTF. Acid and sulfate production as well as pH and metal release varied between the cemented paste treatments, largely as a result of differences in disaggregation rates, which change the reactive surface area. Generally, the cemented paste cylinders with higher binder contents crumbled more slowly and released sulfate, acidity, and metals more slowly. Specifically, the 2% HCT test exhibited greater sulfate and acid release than the 4% test, which was similar to but lower than the 4% with ROM test. All tests began at a pH above 6, which was maintained for weeks 0 and 1 in the 2% HCT, through week 3 in the 4% HCT and through week 2 in the 4% with ROM HCT.

It is likely that these HCTs conservatively represent the potential rates of oxidation for cemented paste tailings, because tests were run on small, laterally-unconfined cylinders with a higher surface area to mass ratio than would exist within the more massive CTF deposits. Furthermore, it is widely accepted that sulfide oxidation in an HCT, which optimizes and accelerates the intrinsic oxidation rate, is typically greater than that under field conditions. Therefore, the disaggregation observed in these tests is considered conservative with respect to ultimate field conditions. The results of early weeks of testing, prior to excessive disaggregation, are, thus, more relevant to geochemistry of paste tailings in the CTF.

Tintina proposes to place 0.5 to 2% paste cement amended materials in its surface CTF and to collect and remove water from that impoundment continuously. Discharge of tailings seepage to surface water is unlikely because mine-affected water will be treated prior to discharge to groundwater. The following discussion, therefore, compares results to groundwater standards, except for the saturated HCT of raw tailings, which represents surface water in a subaqueous tailings facility pond.

Although the initial rates of metal release for cemented paste tailings were generally lower than those for raw tailings, the rates of Al, Cu, Cd, Ni, and TI release from the 2% cement paste HCT approached those of the unsaturated raw tailings HCT after 4 weeks. Metal concentrations in effluent from the 4% HCT were lowest and exhibited isolated

groundwater exceedances for As, Be, Cr, and Tl and more frequent exceedances for Cu and Ni. Similarly, the 4% with ROM HCT exceeded the groundwater quality standard for Cu and Ni in most weeks of testing, with isolated exceedances of Sb, As, Be, Cr, Pb, and Tl. Based on exceedances observed in early weeks, groundwater interacting with oxidized 4% cemented paste tailings backfill could exceed standards for Tl prior to water treatment. These data have been used in geochemical models predicting water quality for various facilities at the Project, and those findings are reported elsewhere (Enviromin, 2017c).

The raw “non-amended” tailings sample tested in the conventional, subaerial kinetic test was strongly acidic and showed a correspondingly high potential to generate sulfate and several metals at low pH. In contrast, the saturated kinetic test of non-amended tailings showed much lower sulfide oxidation, a largely circum-neutral pH, and relatively limited release of metals for approximately 30 weeks of testing. After 35 weeks of testing, alkalinity was depleted and pH dropped notably. At the lower oxidation rate in the saturated HCT, which is intended to represent tailings deposited in a subaqueous impoundment pond, fewer metals initially exceeded relevant groundwater and surface water quality standards. After 35 weeks of testing, when alkalinity was depleted and pH dropped, and metal concentrations rose to exceed numerous relevant groundwater and surface water quality standards.

### **5.3 Recommendations**

Despite the clear buffering capacity of the waste rock, these rocks are sulfidic and have potential to release some metals during oxidation. Therefore, Enviromin has recommended that these rocks be managed through placement in lined facilities to allow the collection and treatment of affected water. Tintina thus proposes that waste rock will be temporarily stored on a lined pad and then be used to construct the underdrain for (and ramp into) the double-lined CTF, where waste rock would then become encapsulated in paste tailings. Based on the results presented here, Enviromin has recommended that Tintina collect all seepage from the waste rock stockpile, the CTF, and the underground workings for treatment prior to discharge via underground infiltration galleries. Results of water quality predictions suggest that this will keep potential impacts to surface and groundwater low (Enviromin, 2017c).

Results of HCTs indicate that all cemented paste amended tailings treatments have the potential to oxidize when weathered subaerially (after a lag time) and to release at least some sulfate, acidity, and metals if left exposed to air and water. Importantly, this is not observed immediately in test cells, and the rate of optimized weathering in a humidity cell is recognized to be substantially greater than in the field. In the CTF, each new lift of cemented paste tailings will behave as a massive block of material with low transmissivity, with a thin upper surface that will be exposed to some degree of oxidation before being covered by fresh paste tails within days of placement. Enviromin has therefore recommended that the cement pasted material be covered in a timely manner (on the scale of weeks) to minimize oxidation, acidity, and leaching of metals. Oxidation would thus be limited to the immediate surface of the cemented paste tailings and any water interacting with oxidized tailings will react with dominantly net neutralizing waste rock before being collected within a lined facility for treatment.

At closure, Tintina has elected to cover the paste tailings deposit with a recommended final lift of 4% cemented paste tailings. They also propose use of a geotextile membrane cover, which will eliminate long-term exposure of the final lifts to oxygen and water. The double-lined CTF with drainage collection is designed to prevent discharge to surface

water and groundwater. Thus, any solutes resulting from oxidation and release of metals by cement-amended tailings within the CTF are unlikely to reach or affect surface water or groundwater.

Though subaqueous placement of raw tailings appears to be effective at limiting sulfide oxidation, some release of metals to the tailings pond would be expected to occur in concentrations exceeding surface water standards. There is also a potential for pH to drop if alkalinity is depleted. For these reasons, Enviromin does not recommend a subaqueous storage alternative. Significant acid rock drainage should be expected to develop in subaerially weathered, fine-grained raw tailings, suggesting that a “dry stack” alternative management scenario may not be effective. Backfill placement of 4% cemented paste tailings offers the best potential to reduce sulfide oxidation.

## Executive Summary

Tintina Resources is evaluating the economic feasibility of the Black Butte Copper deposit, located approximately 17 miles north of the town of White Sulphur Springs, in Meagher County, MT. Mineral exploration is ongoing, and would be advanced underground through a decline proposed for construction. This report describes baseline characterization of acid generation and trace element release potential, and asbestiform mineral occurrence, for rock that would be intercepted during construction of the proposed decline, in support of Tintina's exploration permit. These data will also guide a larger baseline geochemistry study focused on evaluation of the proposed mining operation and alternatives.

**Objective.** Recognizing the locally massive sulfide character of portions of the black shale and dolomite-hosted Cu-Co-Ag mineralization at Black Butte Copper, rock from the 2012 Johnny Lee Decline would be selectively handled and placed into designated waste rock repositories based on non-acid generating (NAG) and potentially acid generating (PAG) classification. The objective of this study was to characterize the rock using static methods of evaluating acid rock and metal release potential, in order to identify selective handling criteria and monitoring/mitigation requirements.

**Methods.** This document describes the multi-element whole rock (ICP, n=248), Acid Base Accounting (ABA, n=48), Net Acid Generation (NAG pH, n=48), Synthetic Precipitation Leachability Procedure (SPLP, n=8), and asbestiform mineral characterization (n=8) results for samples collected from drilling along the alignment of the proposed decline. The decline is designated the "2012 Johnny Lee Decline" to distinguish it from other facilities which may be proposed as exploration continues.

The zone of exploration interest targeted by the 2012 Johnny Lee Decline is the Upper Sulfide Zone (*USZ*), which hosts copper-cobalt mineralization in the calcareous shale of the lower Newland Formation (Resource Modeling, Inc., 2012). The *USZ* zone is overlain by shale and dolostone (*Ynl*), with *0/1 sulfide zone (SZ)* and dolomite (*Ynl 0* "Nose") interbeds, and underlain by the lower Newland footwall shale and conglomerate (*Ynl B*). The 135,000 tonnes of rock to be produced by the decline would thus be comprised of *IG* (<1%), *0/1 SZ* (5%), *Ynl* (41%), *Ynl 0* (6%), *USZ* (11%), *Ynl B* (26%), and copper ore (10%). This study characterized the *IG*, *Ynl*, *Ynl 0*, *Ynl B*, and *USZ* lithotypes.

**Results.** Results of this study indicate that the igneous intrusive (*IG*), lower Newland dolomite "nose" (*Ynl 0*), lower Newland footwall shale and conglomerate (*Ynl B*), and much of the undifferentiated lower Newland Formation (*Ynl*), are strongly net neutralizing and are unlikely to generate acid. With the exception of the *IG*, these lithotypes also have low potential to release metals in concentrations that are likely to exceed groundwater standards, indicating that they can safely be stockpiled off liner. Based on SPLP tests, potential does exist for leachate concentrations to exceed MDEQ surface water standards for aluminum, iron, chromium, and selenium, particularly from the *IG*, suggesting that care should be taken to prevent discharge from the rock pile facilities to surface water.

The *USZ* and *0/1 SZ* should be handled as potentially acid generating (PAG) rock. Due to the occurrence of sulfide interbeds, which increase in frequency with proximity to the *USZ*, the *Ynl* requires further evaluation prior to and during construction of the adit. Results of metal mobility testing using the SPLP method indicate low levels of potential metal release, but are limited by the elevated pH (in some cases, above 9) associated with the high carbonate content of the samples and resulting disequilibrium in the bottle roll tests. For this reason, and to confirm static test predictions of acid generation potential, kinetic tests of *USZ*, *Ynl*, *Ynl O*, and *Ynl B* lithotypes are recommended for initiation as soon as possible, to provide further information for rock handling during construction of the evaluation adit.

There are no identified asbestiform minerals in any of the lithotypes to be mined from the 2012 Johnny Lee Decline at Black Butte Copper.

Rock Management. The results of this study provide clear guidance for management of rock that would be produced from the 2012 Johnny Lee Decline. The lithotypes *USZ* and *0/1 SZ* should be placed in the lined PAG facility based on lithotype. The non-acidic but potentially metalliferous *IG* unit should also be placed in the PAG facility, along with any identified acid subsections of the *Ynl*. An additional 20 samples of the *Ynl* should be tested to develop NAG pH and ABA data for use in operational selective handling during the development of the Johnny Lee Decline. All remaining lithologies can be placed in the NAG facility.

Monitoring and Mitigation. Geological mapping with onsite operational NAG pH testing should be used where needed to screen the *Ynl* for selective handling, with offsite confirmation testing of a subset of samples to allow results to be added to the data presented here. Rock with visual sulfide, or a NAG pH of less than 4.5, should be managed as PAG. Additional metal mobility and kinetic tests of *Ynl* NAG and PAG composites are also recommended, to evaluate the effectiveness management strategy.

Classification of the lithotypes *Ynl O* and *Ynl B* as NAG rock should be verified with limited operational sampling to validate the results of this baseline study and to support efforts to characterize these units for the overall mining operation.

Monitoring of water quality and weathering products within the decline, and in the NAG and PAG waste rock facilities, would provide *in situ* data of use in confirming laboratory test results and interpreting future kinetic test work.

# 1 Introduction

## 1.1 Background

Tintina Resources is evaluating the economic feasibility of its Black Butte Cu-Co-Ag deposit, which is located approximately 17 miles north of the town of White Sulphur Springs, MT (Figure 1-1). Mineral exploration is ongoing, in support of a proposed underground mining operation, and Tintina plans to advance underground delineation of ore reserves through the Johnny Lee Decline shown in Figure 1-2. A thorough baseline characterization of acid generation and trace element release potential is needed to evaluate the proposed underground construction program in compliance with MDEQ regulations for mineral exploration. Such data are also needed for design of mined rock storage facilities to manage rock produced during the exploration program and to plan a geochemical baseline program for the overall mining operation. Enviromin, Inc. was contracted to develop and implement the baseline geochemistry program, which has been conducted in consultation with Tetra Tech.

## 1.2 Johnny Lee Decline Description

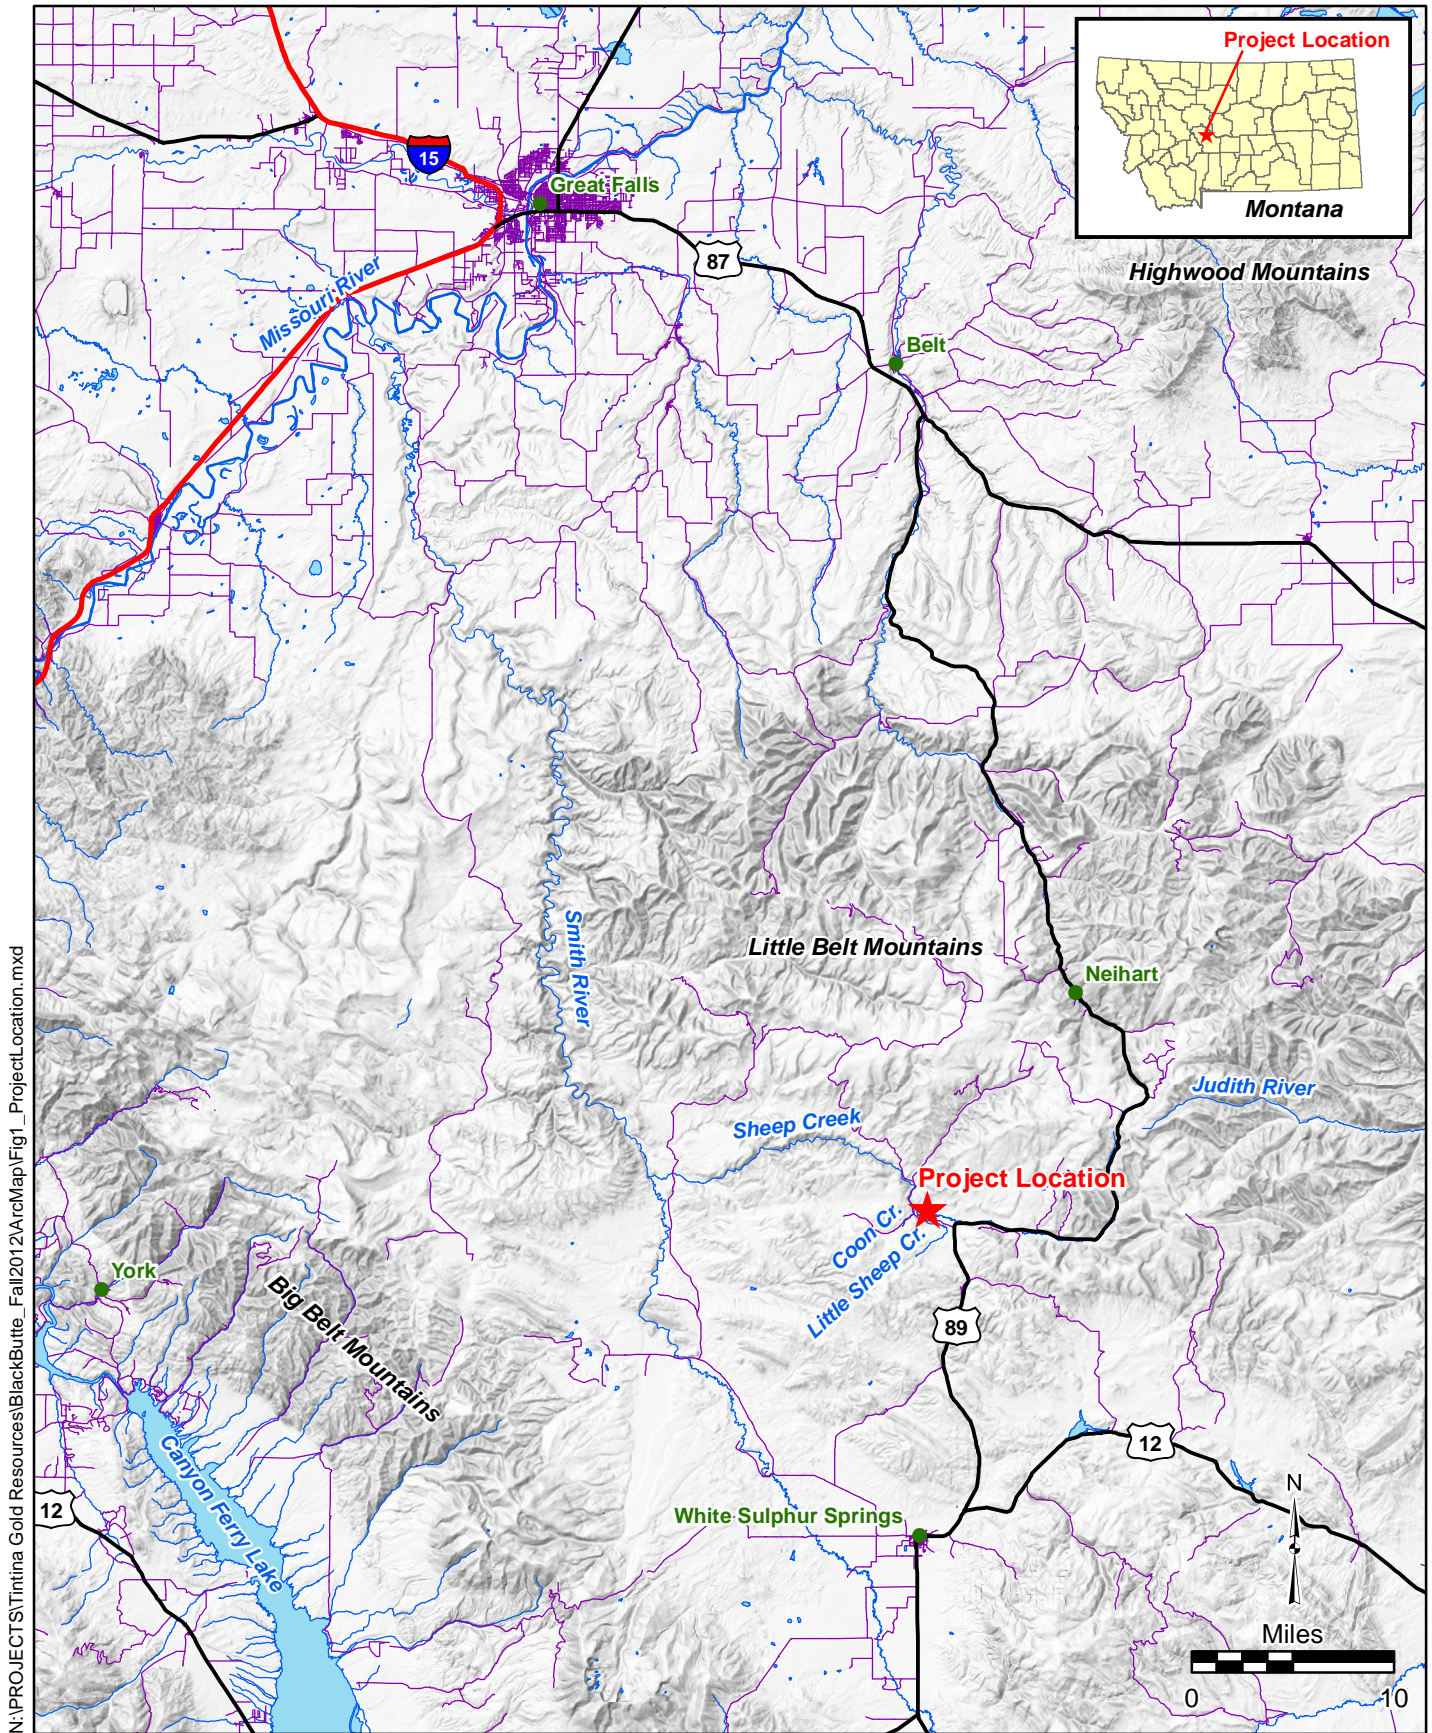

As shown in Figure 1-2, the length of the proposed Johnny Lee Decline is approximately 5200 feet (a horizontal distance of 5000 feet) and is divided into two segments. The first segment trends north-northwest and declines approximately 460 feet in elevation over a distance of approximately 3200 feet. This segment of the decline passes beneath Coon Creek at a depth of approximately 90 feet and ultimately reaches a depth of approximately 250 feet below ground surface at its lower end. The decline then turns to the northwest and the second segment continues at a fixed elevation for an additional 1800 feet.

As mapped in Figure 1-2, the decline is collared in the lower Newland just above the *Ynl 0* Dolomite (aka, the Nose), and is driven through a section of interbedded *Ynl* and *Ynl 0* until the *0/1 SZ* horizon is intercepted just above the *USZ*. The decline is expected to intercept the *Ynl B* footwall unit at the lower end. The decline and intercepted stratigraphy are shown in the cross-section presented as Figure 1-3.

As exploration advances within the Black Butte Copper deposit, the location of facilities may be adjusted to accommodate changing ore deposit models. The decline that is the focus of this study is thus identified as the 2012 Johnny Lee Decline and is distinguished from the previously considered 2011 decline.

Recognizing the massive sulfide nature of mineralization within the Black Butte Copper deposit, Tintina proposes to selectively handle rock for placement onto designated potentially acid generating (PAG) and net acid neutralizing (NAG) waste rock pads to protect water resources. The PAG facility is proposed to be lined and managed as a zero discharge facility, with associated water treatment. The NAG facility would not be lined, unless data collected during the exploration program suggest that a liner is needed.

### 1.3 Geology

The Black Butte Copper ore body consists of a massive sulfide Cu-Co-Ag deposit within the mid-Proterozoic-aged Newland Formation of the Belt Supergroup. The Newland Formation is typically divided into a lower member that consists of primarily dolomitic shale and an upper member of interbedded shales and carbonates (Nelson, 1963).

The massive sulfide sediments were deposited within the Helena embayment and exposed along the Volcano Valley thrust fault at the end of the Laramide orogeny (Resource Modeling Inc., 2012). Ore is hosted in sulfide within marine sediments associated with submarine hydrothermal vents and contains varying amounts of primary and secondary pyrite, chalcopyrite, barite, and silica. Microfossils identified in the sulfides at Black Butte Copper are suggestive of vent fauna grown on submarine hydrothermal vents. Approximately 750 meters of interbedded sulfide mineralization has been defined, with approximately 350 meters of overlying and interbedded carbonate (Resource Modeling, Inc., 2012). The stratigraphy of the Newland Formation shales, dolomites, and interbedded sulfides is shown in Figure 1-4.

The uppermost member of the Upper Newland Formation (*Ynu*) in the vicinity of the decline, which is designated as Unit II (or *Ynu II*) in the Tintina geological model, is a black-gray silty dolomite. Black chert layers and nodules appear in core and outcrop and are a diagnostic feature of the unit. A thin sulfide horizon known as the *II SZ* sulfide zone is developed at the contact between the *Ynu I* and the underlying Unit I (*Ynu I*), a thinly laminated to well-bedded stylonitic, silty dolomite that is typically less than 15 m thick. Sheets of sulfide localized immediately below *Ynu I* provide a definitive stratigraphic marker, known as the *O/I SZ* sulfide zone, indicating the transition to the more sulfidic lower Newland Formation (*Ynl*). This is the uppermost portion of the Newland Formation that will be intercepted by the decline.

The Lower Newland (*Ynl*) is comprised of interbedded black-grey laminar silts, dolostones, and shales. Upper and lower blocks of *Ynl* are separated by a relatively thin interbed of stylonitic, medium grey dolomite known as Unit 0 (*Ynl 0*) or "the Nose". *Ynl 0* is the lowest distinguishable carbonate bed overlying the *USZ*. Above the *Ynl 0*, trace sulfide occurs in local zones of faulting and remineralization, commonly in association with calcite. Below the *Ynl 0*, the *Ynl* contains visible pyrite and barite laminations which increase with depth. Conglomeratic sediments resulting from debris flows associated with submarine turbidites are also visible, and in at least one stratigraphic interval, are laterally continuous across the entire width of the deposit. The *USZ*, which hosts significant copper mineralization, immediately underlies the lower block of undifferentiated *Ynl* and can be up to 100 meters in thickness (Resource Modeling, Inc., 2012). The *Ynl B* unit that lies between the *USZ* and the *MSZ* is comprised of shale and conglomerate.

The zone of exploration interest targeted by the 2012 Johnny Lee Decline is the Upper Sulfide Zone (*USZ*), which hosts Cu-Co-Ag mineralization in the calcareous shale of the lower Newland Formation (Resource Modeling, Inc., 2012). The *USZ* at Strawberry Butte contains fine-grained bedded pyrite up to 55 meters thick with three chalcopyrite-bearing zones. Bornite and chalcopyrite occur in the southern part of the *USZ*. The cobalt minerals are unknown but are most likely cobaltite or glaucodot. Economic grade mineralization is also hosted in the *MSZ*, *Zn SZ*, and *LSZ* sulfide zones, but as those

intervals will not be intercepted by the 2012 Johnny Lee Decline, they are not described in detail here.

Lithotypes that will be intercepted are shown in plan view in Figure 1-2, and listed in Figure 1-4. The stratigraphy along the decline is also shown in cross section in Figure 1-3. The corresponding lithotypes designated for geochemical characterization are listed in Table 1-1, together with estimates of tonnage, and a list of environmentally relevant minerals identified in drill samples.

## **2 Previous Geochemical Characterization**

Mineral exploration in the vicinity of the Black Butte Copper deposit has been ongoing for more than 30 years, and a substantial amount of exploration geochemistry data has been collected (Resource Modeling, Inc., 2012). These historical efforts have focused on assay and multi-element geochemical analyses rather than environmental geochemistry, and are not discussed further in this document, which is specifically focused on the acid generation and trace metal release potential of the rock to be mined from the proposed 2012 Johnny Lee Decline. Recent multi-element exploration geochemistry data were used to guide sample selection for the decline study, however.

### 3 Sampling

The environmental geochemistry of rocks that will be mined from the Black Butte Copper Johnny Lee Decline will be strongly influenced by sulfide, carbonate, and metal-bearing mineralization (Table 1-1). To ensure baseline geochemical data represent the full range of mineralization and metal content observed in samples collected during the 2012 drilling program, a three-phase sampling program was implemented.

Phase one of this program consisted of initial sample collection during the 2012 Johnny Lee Decline drilling program. This program included boring five drill holes along the Johnny Lee Decline alignment (Figure 1-3). Tintina completed a total of 2,030 feet of drilling with 1,424 feet intercepting bedrock. The drilling program produced 248 two-meter (approximate) intervals of drill core collected from bedrock. Each of these samples were described by Tintina geologists and classified according to the rock types identified for geochemical testing, as presented in Table 3-1 (i.e. *USZ*, *Ynl*, *Ynl 0*, *Ynl B*, and *IG*). All samples collected during the 2012 drilling program were submitted for analysis of whole-rock concentrations of 61 elements using the ICP techniques described below in Section 4.3.

<b>Table 3-1. Summary of Geochemical Samples for 2012 Johnny Lee Decline</b>

<i>Ynl 0</i>	17	17	6	1
<i>Ynl B</i>	7	7	7	1

<sup>1</sup> Data distributions for these samples are provided in Appendix A1.

<sup>2</sup> Data distributions for these samples are provided in Appendix A2.

The second phase of the sampling program consisted of selecting a subset of samples representing each individual rock type to submit for static tests of acid generation potential (Acid base Accounting and Net Acid Generation pH tests described in Section 4). The total sulfur concentration of samples measured using ICP was used to guide selection of static test samples. Specifically, the distribution of total sulfur concentrations measured for all samples of a respective lithotype were plotted and subsamples selected to match that distribution as closely as possible. Figure 3-1 provides an example showing the percentage of all *IG* samples with total sulfur concentrations falling within a certain range (blue bars) and the same data for the percentage of samples selected for static testing (red bars). Similar graphs for the other lithotypes are included in Appendix A-1.

A third phase of sampling was focused on development of composite samples for each lithotype to submit for metal mobility testing and asbestiform mineral characterization. The process for this phase of sampling was similar to that used to select samples for static testing, in that it relied on statistical analysis of the ICP results for key elements. However, instead of selecting a smaller number of discrete samples across the observed distribution, the goal of this phase was to construct a single 11 kg to 12 kg composite sample representing each individual lithotype.

**Figure 3-1. Sulfur Distribution for All *Ynl 0* Samples and *Ynl 0* Samples Selected for Static Testing.**

Metal mobility compositing relied on ICP data for arsenic, iron, sulfur, and zinc concentrations as these elements are likely to be important in this style of mineralization. Distributions of these element concentrations were again plotted for the entire 2012 sample pool for each lithotype. Individual subsamples were selected and the weights of each to include in the composite were adjusted such that the percentage of material in each composite and their element concentrations reflected the distributions for the overall sample pool. Examples of this strategy for the *Ynl 0* composite iron and zinc concentrations are shown in Figures 3-2 and 3-3. The percentage of samples in the overall sample pool having a certain concentration of each element is depicted with blue bars while the percentage of material in the composite with those concentrations is represented by red bars. Similar distributions for the remaining composite samples and for all five of the target elements are included in Appendix A-2.

Figure 3-2. Iron Distribution for All *Ynl O* Samples and *Ynl O* Composite Sample.

Figure 3-3. Zinc Distribution for All *Ynl O* Samples and *Ynl O* Composite Sample.

During the third phase of sample selection, review of the multi-element ICP data indicated that development of multiple composite samples for the *USZ* and *Ynl* lithotypes was warranted. The rationale for their construction and inclusion in the study is outlined below:

- USZ rock type. Samples from the Upper Sulfide Zone appeared to have a bimodal distribution of iron concentrations. Therefore, two composites of this material were submitted for metal mobility testing; Composite 1 is comprised of material with comparatively high iron concentrations, and Composite 2 contains material with low iron concentrations. This was done to facilitate geochemical understanding, and does not necessarily correspond to a selective handling strategy.
- Ynl rock type. The Lower Newland rock type represents the greatest proportion of waste that would be excavated while driving the Johnny Lee Decline and also represents the greatest number of sample intervals intercepted during the 2012 drilling program. For these reasons it was decided that two composites of this material would be submitted for metal mobility testing in order to test for variability in metal release from this material.

## 4 Static Testing

Static testing methods were used to evaluate both acid generation and metal release potential. Static testing, which refers to analysis at a fixed point in time, differs from kinetic testing which measures changes in oxidation and solute release over time. The Acid Base Accounting (ABA) and Net Acid Generation (NAG) pH methods were used to evaluate potential for acid generation. Multi-element tests of rock composition (ICP) were used to evaluate whole rock metal content, and the EPA method 1312 Synthetic Precipitation Leachability Procedure (SPLP) was used to evaluate potential metal mobility.

### 4.1 Acid Base Accounting

Sulfide minerals in waste rock, particularly pyrite, react with water and oxygen to produce sulfuric acid ( $H_2SO_4$ ), which can be neutralized by minerals capable of consuming acid, such as calcite. The ABA test measures the relative acid production and neutralization properties of a mine waste material based on the conservative assumption that all sulfide present in a rock will oxidize, releasing acidity. The acid base accounting test quantifies the acid production potential (AP) and neutralization potential (NP) of a sample in units of tons  $CaCO_3$  / kiloton of rock (Sobek et al. 1978), allowing calculation of the net neutralization potential (NNP) as NP less AP and the neutralization potential ratio (NPR) as NP divided by AP (INAP, 2012). The ABA test uses a relatively complete digestion of finely ground rock, and therefore conservatively estimates the reactivity of available sulfide minerals.

To determine neutralization potential, a sample is treated with excess standardized hydrochloric acid (HCl) at ambient temperatures for 24 hours. The remaining acid is titrated with a standardized base to pH of 8.3 after the test is complete to allow the calculation of calcium carbonate equivalent for acid consumed. This study used the modified Sobek method of ABA analysis, which uses a fizz test to adjust the amount of acid used in alkalinity titration.

Review of the sulfur-bearing minerals in Table 1-1 indicates that both sulfide and sulfate minerals occur within the Black Butte Copper deposit. Sulfur was therefore fractionated to identify the sulfide, acid soluble and insoluble sulfate, and residual sulfur fractions. Total sulfur was determined by LECO S, and total sulfate sulfur was measured by analysis of the carbonate soluble sulfur fraction. Sulfide was then calculated by subtracting total sulfate from total sulfur. Acid insoluble sulfate was calculated by subtracting the HCl-soluble sulfate from the total sulfate. Barium determined by x-ray diffraction was used to calculate the amount of barite present. Potential acidity (AP) was calculated based on sulfide sulfur for this study.

The NNP and NPR are used by regulatory agencies to assess acid generation potential of rock samples based on the criteria shown in Table 4-1. Samples falling in the "uncertain" category require kinetic testing using humidity cells to evaluate whether they would generate acidic leachate over an extended period of weathering.

<b>Table 4-1. Criteria for Classifying Acid Generation Potential of Rock Samples</b>		
<b>Classification</b>	<b>ABA Criteria<sup>1</sup></b>	<b>NAG Criteria<sup>2</sup></b>
Potentially Acid Generating	NP:AP < 1 and NNP < -20 tons/kton	Final NAG pH < 4.5
Uncertain Acid Generation Potential	NP:AP between 1 and 3 and/or NNP between -20 and +20 tons/kton	
Unlikely to Generate Acid	NP:AP > 3 and NNP > +20 tons/kton	Final NAG pH > 4.5

<sup>1</sup> From BLM (1996) and USEPA (1994).

<sup>2</sup> INAP (2012) GARD Guide

Results of the acid base accounting analyses provided in Table 4-2 and Figure 4-1 indicate that the igneous intrusive *IG*, *Ynl 0* dolomite, *Ynl B* and the *Ynl* lithotype samples are strongly net neutralizing with little potential to generate acid.

The *Ynl* samples are net neutralizing and the statistical summary provided in Table 4-2 suggests that the *Ynl* lithotype is not acid generating, but due to the occurrence of sulfide interbeds, which increase in frequency with proximity to the *USZ*, the *Ynl* requires further evaluation prior to and during construction of the adit. Review of the stratigraphy in drill logs indicates that sulfide in the upper *Ynl* (above the *Ynl 0* dolomite) occurs in trace quantities in local interbeds within carbonaceous rock and may only be locally enriched to concentrations that could produce significant acidity. In the lower *Ynl*, sulfide content is higher and more consistent, with local interbeds such as the *0/1 SZ*, as the rock transitions to the more massive sulfide mineralization of the lower ore zones. If the frequency of acidic rock in the overall *Ynl* is low, it may be possible to rely on the strongly net neutralizing character of the remaining *Ynl* and other non-*USZ* lithotypes to neutralize any acid that is produced. The collection of additional *Ynl* samples for static testing is thus highly recommended prior to placement of any *Ynl* in the NAG waste rock facility.

The *USZ* and a minor portion of the lower Newland Formation (*Ynl*) are potentially acid generating, however. Within the *USZ*, rock with lower iron has lower acid generation potential than rock with high iron content. This likely corresponds to the presence of higher concentrations of acid generating pyrite, FeS<sub>2</sub>, in the higher iron *USZ* rock. There is also a difference in sulfate mineralization, with the highest sulfate concentrations in the *USZ* associated with the high Fe samples. In spite of these differences, all of the *USZ* samples have an NP/AP ratio below 3, with a strongly acidic mean NNP of -323 T CaCO<sub>3</sub>/kT rock, and should be considered potentially acid generating (PAG). For this reason, following the initial ABA work, high and low Fe *USZ* samples were not distinguished from one another for NAG and metal mobility work.

Figure 4-1. Acid Generation Potential for 2012 Johnny Lee Decline.

**Table 4-2. Summary of Acid Base Account Data for 2012 Johnny Lee Decline Samples**

Lithology	Number of Samples	Minimum	Mean	Maximum
<b>NP:AP<sup>1</sup></b>				
IG	8	10	24	52

Ynl B	7	281	315	370

<sup>1</sup> NP:AP is the ratio of neutralization potential to acid generation potential, based on sulfide S.

<sup>2</sup> NNP is net neutralization potential in units of tons CaCO<sub>3</sub> / kT of rock.

## 4.2 Net Acid Generation

The net acid generation pH (NAG pH) test is a method of evaluating the acid generation potential of a sample which relies on oxidation of a ground sample using hydrogen peroxide (INAP, 2012). The NAG pH method avoids the potential bias of assumptions in the ABA method including sulfide mineralogy stoichiometry and the relative efficiency of speciation methods.

A 2.5 gram sample is pulverized and 250 mL of 15% H<sub>2</sub>O<sub>2</sub> is added. The sample reacts overnight, and is then heated for up to 2 hours to remove excess H<sub>2</sub>O<sub>2</sub> and encourage the release of inherent neutralizing capacity. The sample is allowed to cool, ending pH is measured, and the solution is then titrated to pH 4.5 and 7.0. A pH after reaction (NAG pH) of less than 4.5 indicates that the sample is net acid generating.

The results of the NAG pH analyses for Black Butte Copper summarized in Table 4-3 and compared with the NPR in Figure 4-2 support the results of the ABA testing. The *Ynl O* and *IG* lithotypes are net neutralizing, and the *USZ* is clearly acidic, although the low Fe samples are less so. The *Ynl* and *Ynl B* are also neutralizing in most samples, but a small number of samples have some potential to produce acid, as is indicated by the amount of titrated acid per tonne shown in Table 4-3. Neither of these lithotypes had an acidic final NAG pH, however. Figure 4-2 provides a clear illustration of the distinction between the acidic *USZ* and other net neutralizing lithotypes,

### 4.3 Multi-Element Whole Rock Chemistry

Multi-elemental analyses of rock composition were measured as part of the exploration program and used to develop a framework to facilitate sample selection and development of composites for mineralogy and metal mobility testing. Whole-rock data may also be useful for “fingerprinting” samples during mining operations and correlating future samples with those included in the baseline characterization.

The elemental composition of the samples was determined using inductively coupled plasma-atomic emission spectroscopy following a 4-acid digestion with a mixture of perchloric, nitric, hydrofluoric and hydrochloric acids, in order to fully dissolve the mineral matrix, including the silicates (ALS Chemex Method MEICP61a). The results of the multi-element analyses used to describe and sample the Black Butte Copper samples are summarized in Table 4-4, and indicate differences in variability by element between lithotypes. These differences are explored in the histograms provided in Appendix A.

#### 4.4 Metal Mobility Tests

The Synthetic Precipitation Leaching Procedure (SPLP) is a U.S. EPA (2007) method designed to determine the mobility of both organic and inorganic analytes present in liquids, soils, and wastes. Waste rock is digested using an unbuffered pH 5 solution acidified with 60% H<sub>2</sub>SO<sub>4</sub> and 40% nitric acid (HNO<sub>3</sub>), at a liquid-solid ratio of 20:1. The sample is rolled in a bottle for 18 hours, after which the sample is filtered using a 1 microgram glass frit and analyzed for total recoverable concentrations of constituents of interest at detection levels appropriate to regulatory standards, typically using ICP-AES or ICP-MS. The final pH is also measured.

The metal mobility test provides an indication of the metals which have potential to be released from rock exposed to meteoric water, but the actual concentrations are sensitive to the rock:water ratio used in the test as well as the final pH. Concentrations measured in extracts should therefore be interpreted with caution (Fey, 2003). The metals detected in extracts from the Black Butte Copper composites are compared with MDEQ surface and groundwater standards for convenience, but this should not be construed to infer that the measured concentrations represent ultimate water quality under field conditions.

The metal mobility results for the Black Butte project are shown in Table 4-5; results which exceed relevant MDEQ water quality standards are bolded in the table. In these alkaline solutions, where final pH was always above 8.4, the metal concentrations were quite low and with the exception of iron, did not exceed groundwater standards. The metals antimony, arsenic, beryllium, cadmium, cobalt, copper, mercury, nickel, silver, thallium, uranium, and zinc were below detection in all extracts. The metals aluminum, iron, and chromium were detected in concentrations which exceed surface water criteria in the igneous intrusive extracts. The high concentrations of aluminum likely reflect the influence of artificially elevated final pH of the SPLP extracts (over 9), which are unlikely to be observed under field conditions, on colloidal aluminum in the total recoverable analysis of 1 microgram filtered water. The lower Newland tests also indicated potential for release of aluminum at a concentration that exceeds the surface water criterion, and selenium was detected in one each of the *USZ* and *Ynl* extracts at the surface water standard. Aluminum was detected at the surface water standard in an extract of the high Fe *USZ*. These results are consistent with water quality observed in local surface and groundwater (Hydrometrics, 2012).

**Bold** values indicate concentrations that exceed lowest applicable standard.

<sup>1</sup> Constituents measured at concentrations below the reporting limit were excluded from this table (i.e. antimony, arsenic, beryllium, cadmium, cobalt, copper, mercury, nickel, silver, thallium, uranium, and zinc). SPLP concentrations are total recoverable.

<sup>2</sup> Reported surface water standards are lowest of applicable MDEQ 7 (August 2012) standards. Groundwater standards based on dissolved concentrations, surface water based on total recoverable.

<sup>3</sup> Aluminum standard is based on dissolved concentration and applicable to waters with pH between 6.5 to 9.0 only.

<sup>4</sup> Standard reported for chromium assumes all chromium is present as Cr (VI).

<sup>5</sup> Groundwater standards for iron and manganese are 2010 MDEQ-7 secondary standards.

<sup>6</sup> Hardness dependent standards (i.e. lead) calculated based on 25th percentile hardness concentration in Sheep Creek (130 mg/L).

## 5 Asbestiform Minerals

Asbestiform serpentine and amphibole minerals do not typically occur in carbonaceous sedimentary deposits. Chrysotile fibers are most commonly found in serpentized ultramafic and dolomitic marbles. Although amphibole minerals are widely found throughout the earth's crust, only a few varieties exhibit the rare asbestiform habit that results from mechanical shearing and/or high temperature metamorphism. Asbestiform mineralization is therefore highly unlikely in the Black Butte copper deposit. To confirm the absence of such mineralization, the composites used to evaluate metal mobility were also screened for the presence of asbestiform minerals at the request of the Montana Department of Environmental Quality.

The presence/absence of chrysotile, amosite, crocidolite, anthophyllite, tremolite, and actinolite was evaluated by the R.J. Lee Group using Polarized Light Microscopy (PLM) methods at a 400 point count, followed by evaluation of any identified asbestiform fibers following U.S. EPA regulations. Any samples containing uncertain or demonstrated asbestiform mineral content were to be analyzed using Transmission Electron Microscopic (TEM) analysis to clearly distinguish between mineral cleavage and fibers, along with element analysis of the samples. For this project, detection between 0.001 and 0.1 weight percent was required.

All samples submitted for asbestiform mineral screening were determined to be composed of 100% non-fibrous minerals with no asbestos detected during PLM analysis. For this reason, confirmation testing using TEM methods was not warranted. Results of these analyses are provided in Appendix B.

## 6 Conclusions and Recommendations

There are no identified asbestiform minerals in any of the lithotypes to be mined from the 2012 Johnny Lee Decline at Black Butte Copper.

Results of this study indicate that the *IG*, *Ynl 0*, *Ynl B*, and the *Ynl*, are net neutralizing and are unlikely to generate acid. Apart from the *IG*, which showed elevated metal concentrations in SPLP extracts, these lithotypes have low potential to release metals in concentrations that are likely to exceed groundwater standards, suggesting that they can safely be stockpiled off liner as NAG with confirmation testing. Potential does exist for leachate to develop concentrations which could exceed surface water standards for aluminum, iron, chromium, and selenium, particularly from the *IG*, suggesting that care should be taken to prevent discharge from the rock pile facilities to surface water. Given the small tonnage of *IG* that would be intercepted, it might be best to place *IG* on the PAG facility to avoid associated release of metal. Potential for metal release should be confirmed through kinetic testing and with *in situ* monitoring in the evaluation adit.

The *USZ* and *0/1 SZ* are potentially acid generating, with potential to release aluminum, and selenium, and will require management as PAG. The occurrence of sulfide interbeds with increasing frequency in the *Ynl* with proximity to the *USZ* indicates that careful selective handling based on detailed geological mapping, hand specimen analysis, and operational NAG pH analysis should be used operationally to distinguish these two lithotypes for proper handling.

### 6.1 Rock Management Recommendations

Results of this baseline geochemistry study for the 2012 Johnny Lee Decline suggest that at least 70%, and perhaps as much as 80%, of the 135,000 tons of rock to be mined during construction is non-acid generating with low potential to release metals. The rock to be mined from the Black Butte Copper 2012 Johnny Lee Decline would be selectively handled and placed into designated waste rock facilities based on NAG and PAG designations. The *USZ*, as expected, would be acid generating, and should be handled as PAG, along with the *0/1 SZ*, the *IG*, and minor acid portions of the *Ynl*. Rock from *Ynl 0*, *Ynl B*, and much of the *Ynl*, can be placed as NAG. Results of this study suggest that a final NAG pH greater than 4.5 and/or an NP:AP ratio above 3 will suitably discriminate between NAG and PAG material for selective handling purposes.

Additional sampling and analysis, particularly of the *Ynl*, will be conducted prior to and during the decline construction and operation program. The baseline results presented here are based on limited analysis of a relatively small number of drill samples, and will be validated through analysis of an additional 20 samples of *Ynl* using ABA and NAG pH methods prior to initiation of work in the Johnny Lee Decline. Kinetic testing of the *USZ*, *Ynl*, *Ynl 0*, and *Ynl B* are also recommended, to confirm the results of the static and metal mobility testing reported here. Results of this work will be reported by Enviromin in two separate reports to Tintina.

Operational geochemical sampling and analysis would be needed to support selective handling of the *Ynl* from the evaluation adit, and to confirm the NAG classifications of lithotypes based on drill samples. These efforts would support the decline mining operation in the short term, and would inform the overall geochemical baseline study that

is planned for the proposed mining operation. The criteria put forward in Table 6-1 are intentionally conservative, to prevent any problems associated with the unlined NAG facility and to provide information for future geochemical studies for the larger proposed mining operation. The implementation of this rock management program involves three recommended levels of additional operational analysis during the Johnny Lee Decline program:

1. NAG Confirmation Sampling. The sampling strategy for this baseline study was focused on covering the range of variation observed in lithology, hand specimen mineralogy, and exploration geochemistry of observed in a small number of drill samples. Although the number of tested samples is high, relative to the low proposed tonnage for each lithotype, Tintina should confirm the baseline results through collection of additional samples for static analysis during construction of the adit, to provide infill information between the intervals sampled by drilling. Additional samples would be collected from each lithotype during decline construction, the number of which would be justified through geologic mapping of exposed rock. These samples would be subjected to further testing using NAG pH, with splits archived for offsite confirmation NAG and ABA testing, as well as possible additional metal mobility and kinetic work. This testing could be conducted on or offsite, depending upon the need to conduct Ynl NAG pH screening onsite during decline construction.

Lithotype	% tonnage	Designation	Criteria	Justification	Add. Data <sup>1</sup>
Ynl O	6	NAG	lithology	NAG pH > 4.5, NP:AP > 3, low metals	Confirmation sampling
Ynl B	26	NAG	lithology	NAG pH > 4.5, NP:AP > 3, low metals	Confirmation sampling
Ynl	41	NAG	Operational NAG pH < 4.5	NAG pH > 4.5, NP:AP > 3, low metals	Mapping, static analyses, kinetics
Ynl sulfide	Unknown % of Ynl	PAG	Operational NAG pH < 4.5	NAG pH < 4.5, NP:AP < 3	Mapping, static analyses, kinetics
O/1 SZ	5	PAG	lithology	Nd	none
IG	<1	PAG	lithology	Elevated SPLP metals	Confirmation sampling
USZ	11	PAG	lithology	NAG pH < 4.5 NP:AP < 3	none
Copper Ore	10	PAG	lithology	Nd	none

<sup>1</sup> See detailed testing plan below

<sup>2</sup> Nd – not determined

Note: O/1 SZ and Copper Ore were not included in the baseline geochemistry study for the decline

2. Delineation and potential operational NAG testing of the Ynl to identify PAG fraction

- a. Review the results of the additional 20 ABA and NAG pH tests of *Ynl* conducted prior to decline construction to determine need for further operational testing during decline constructions with agencies.
  - b. Detailed geologic mapping of the *Ynl* to define sulfide distribution and locate zones of sulfide enrichment, relative to stratigraphic markers of relevance to mining operations. Identify sedimentary or structural features controlling sulfide occurrence, in anticipation of operational selective handling. Collect *Ynl* samples for static and kinetic analysis to represent observed variation.
  - c. These samples would be screened initially, with all rock having visual sulfide sent for handling as PAG. Any rock not identified as PAG would be subjected to further testing using NAG pH test method.
  - d. Onsite NAG pH testing during construction would be used operationally to differentiate between NAG and PAG rock within the *Ynl* material which passes the initial visual screening tests. Materials with final NAG pH less than 4.5 would be placed in the lined PAG repository. Materials with NAG pH above 4.5 would be designated as non-acid generating material.
  - e. Splits for ABA, as well as confirmation NAG pH testing, would be collected for offsite analysis, to allow correlation with baseline analyses (Figure 2) and onsite analyses.
  - f. One composite each of delineated NAG and PAG *Ynl* would be submitted for both metal mobility and kinetic humidity cell testing.
3. *In situ* monitoring of water quality in decline and on NAG/PAG waste rock pads.

Water quality would be monitored on or near the waste rock pads, and in the decline, over a period of years, to evaluate changes in chemistry due to weathering of exposed and blasted rock. Also, analysis of mineral products of weathering is also recommended for both run-of-mine NAG and PAG. Results of this *in situ* work would be important for use in scaling future kinetic test results during the site-wide baseline geochemistry program.

Results of the exploration adit geochemical sampling and static testing program would be submitted in quarterly reports to the agencies during construction, and in an annual report following construction for any longer term water quality monitoring. A separate report would be prepared describing the selective handling, metal mobility, and kinetic testing of the *Ynl* NAG and PAG materials.

## **6.2 Implications for Overall Geochemistry Baseline Study**

The data presented here are focused on characterization of the lithotypes to be intercepted during construction of the 2012 Johnny Lee Decline, based on sampling in the vicinity of this decline, and should not be interpreted to represent the environmental geochemistry of all rock to be mined at Black Butte Copper. Nevertheless, these results provide important information which should be considered in future testing and evaluation, including:

1. The NAG pH and ABA tests together provide a clear indication of potential acid generating material for the project. It would be useful to continue both types of analysis through the remainder of the baseline program, with a goal of defining a

- robust set of NAG criteria for operational use in selective handling within units like the *Ynl*.
2. Metal mobility predicted by SPLP extraction of drill core samples is generally low, but cannot reflect changes that may result from oxidation as weathering progresses. Also, the pH of the SPLP tests were higher than is likely to be observed under field conditions. Alternative methods such as the Nevada Meteoric Water Mobility Procedure (MWMP) should be considered for future work. Metal mobility should also be evaluated in kinetic tests, together with *in situ* field scale monitoring of waste rock facilities, to better understand potential shifts in metal mobility related to sulfide oxidation.
  3. Initial multi-element, ABA, and NAG test results indicate relatively low variability in composition and acid generation potential for the *IG*, *Ynl O*, *Ynl B* and *Ynl* units, with much greater variability for the *USZ* lithotypes. Geologic results suggest that additional *Ynl* samples should be collected prior to initiation of work in the decline. These observations should be confirmed during the next phase of sampling, and the number of samples collected within rock type adjusted to reflect both the observed variability and relative tonnage of rock units.
  4. In spite of the massive sulfide mineralization in targeted ore zones, much of the waste rock is strongly neutralizing and exhibits low potential for metal release. These initial conclusions should be confirmed through additional sampling and analysis of rock collected throughout the larger proposed mine area.
  5. *In situ* monitoring of water quality underground, and on the waste rock pads, will provide important information regarding field scale weathering processes which will inform the overall geochemistry program. These data will be especially useful in scaling the application of laboratory data to field scale predictive water quality models.

### 6.3 Conclusions

Placement of *USZ* and acid *Ynl* rock from the decline into the lined PAG facility, with the remainder of the rock placed into the unlined NAG facility, will protect groundwater during construction of the Johnny Lee Decline. Water accumulating in the underground workings and PAG sump may require treatment to neutralize acidity and remove metals, while water from the NAG facility should be suitable for LAD discharge. As both facilities will be constructed to prevent surface water discharge, there is little risk of impact to surface water resources. Sampling and static analysis to confirm NAG classification, with more in depth static and kinetic study of the *Ynl* NAG and PAG sub-lithotypes, and water quality monitoring of underground and waste rock storage facilities will allow Tintina to effectively manage risk associated with rock to be mined from the decline.

The construction of the 2012 Johnny Lee Decline provides an opportunity for Tintina to advance understanding of sulfide distribution and environmental geochemistry within the lower Newland formation, the results of which would benefit the broader environmental geochemistry program for the proposed mining operation. More importantly, it provides an opportunity for Tintina to demonstrate an ability to selectively handle and appropriately manage potentially acid generating rock at Black Butte Copper during future operations.

**CERTIFICATE RE12122929**

Project: Sheep Creek  
 P.O. No.:  
 This report is for 41 Crushed Rock samples submitted to our lab in Reno, NV, USA on 6- JUN- 2012.  
 The following have access to data associated with this certificate:

JACK COTE JERRY ZEIG	LISA KIRK	VINCE SCARTOZZI
-------------------------	-----------	-----------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
PUL- QC	Pulverizing QC Test
PUL- 31	Pulverize split to 85% < 75 um
SPL- 21	Split sample - riffle splitter

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	
OA- VOL11	Static Net Acid Generation	
OA- VOL08	Basic Acid Base Accounting	
S- IR08	Total Sulphur (Leco)	LECO
OA- ELE07	Paste pH	
S- CAL06	Sulfide Sulfur (calculated)	LECO
S- GRA06	Sulfate Sulfur- carbonate leach	LECO
S- GRA06a	Sulfate Sulfur (HCl leachable)	

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim 'or deposit has been determined based on the results of assays of multiple samples of geological materials collected by the prospective investor or by a qualified person selected by him/her and based on an evaluation of all engineering data which is available concerning any proposed project. Statement required by Nevada State Law NRS 519

## ANALYTICAL SUMMARY REPORT

August 23, 2012

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B12080959

Project Name: Black Butte Copper Proj., White Sulphur Springs, M

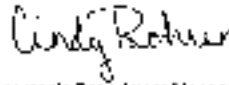

Energy Laboratories Inc Billings MT received the following 8 samples for Tintina Alaska Exploration Inc on 8/9/2012 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B12080959-001	IG		08/09/12	Solid	Metals by ICP/ICPMS, SPLP Mercury, SPLP pH, SPLP Digestion, Mercury by CVAA SPLP Extraction, Regular Digestion, Total Metals
B12080959-002	USZ 1, High Fe		08/09/12	Solid	Same As Above
B12080959-003	USZ 2, Low Fe		08/09/12	Solid	Same As Above
B12080959-004	Ynl 1		08/09/12	Solid	Same As Above
B12080959-005	Ynl 2		08/09/12	Solid	Same As Above
B12080959-006	Ynl 0		08/09/12	Solid	Same As Above
B12080959-007	Ynl B, 2012 Decline		08/09/12	Solid	Same As Above
B12080959-008	Ynl B 2, Orig. Decline		08/09/12	Solid	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

**Synthetic Precipitation Leaching Procedure Testing**

Each composite sample is to be analyzed for metal mobility using EPA Method 1312 SPLP test methodology. Please select the minimum representative aliquot of each composite sample necessary to complete the testing. SPLP test extracts are to be analyzed for the constituents listed in **Table 2**.

Please report the results of SPLP testing (including a data file in Microsoft Excel format) to Shane Matolyak at the following email address; [shane.matolyak@tetratech.com](mailto:shane.matolyak@tetratech.com)

Tintina Resources should be invoiced directly for this work.

**Table 2.  
List of Parameters for SPLP Testing**

<b>Parameter</b>	<b>Reporting Limit (mg/L)</b>	<b>Parameter</b>	<b>Reporting Limit (mg/L)</b>
pH	0.1 (s.u.)	Magnesium	1
Aluminum	0.03	Manganese	0.005
Antimony	0.003	Mercury	0.00001
Arsenic	0.003	Molybdenum	0.001
Barium	0.005	Nickel	0.01
Beryllium	0.001	Potassium	1
Cadmium	0.00008	Selenium	0.001
Calcium	1	Silver	0.0005
Chromium	0.001	Sodium	1

Copper	0.001	Thallium	0.0002
Iron	0.05	Uranium	0.00003
Lead	0.0005	Zinc	0.01

**Sample Splitting and Shipping**

A representative 100 to 200 gram aliquot of each composite sample should be split off and sealed in zip-lock bags labeled with the composite identification. These samples are to be shipped to the RJ Lee Group for analysis of potentially asbestiform mineral content. Please ship these samples, under chain-of-custody with the attached analytical request, to the following address.

Mr. Bill Powers, Manager of Optical Group  
 RJ Lee Group  
 350 Hochberg Road  
 Monroeville, PA 151446

B-4 R.J. Lee Asbestiform Mineral Characterization

## Laboratory Report

Tetra Tech Inc  
 851 Bridger Drive  
 Suite 6  
 Bozeman, MT 59715  
 United States  
 Attention: Shane Matolyak  
 Telephone: 406-582-8780

Report Date 09/04/2012  
 Sample Receipt Date 08/17/2012  
 RJ Lee Group Job No. AOH1023419-0  
 Authorization/P.O. No.  
 Client Job No./Name 114-710301-200

Analysis: Asbestos in Bulk Samples by Point Count  
 Method: EPA/600/R-93/116

RJLG Sample Number	Client Sample Number	Homogeneous	# of Layers	Asbestos Detected(%)	Non-Asbestos Fibers(%)	Non-Fibrous Materials(%)	Matrix Material	Analyst - Analysis Date
10210420.HPL	IG	Yes	1	ND		100.00	CA, AM, OP, MI, M	WHP-09/04/2012
Description:		Gray Crushed Rock No asbestiform minerals detected. Contains 10.5% cleavage fragment amphibole.						
Weight Loss:		0.0%						
10210421.HPL	USZ 1 (High Fe)	Yes	1	ND		100.00	Q, CA, OP, MI, M	WHP-09/04/2012
Description:		Gray Crushed Rock No asbestiform minerals detected.						
Weight Loss:		0.0%						
10210422.HPL	USZ 2 (Low Fe)	Yes	1	ND		100.00	Q, CA, OP, M	WHP-09/04/2012
Description:		Gray Crushed Rock No asbestiform minerals detected.						
Weight Loss:		0.0%

Authorized Signature: \_\_\_\_\_

William H. Powers, Manager-Optical

**ASBESTOS**

- AM = Amosite
- AC = Actinolite
- AN = Anthophyllite
- CH = Chrysotile
- CR = Crocidolite
- TR = Tremolite

**NON-ASBESTOS**

- CE = Cellulose
- MW = Mineral Wool
- FG = Fibrous Glass
- SF = Synthetic Fibers
- H = Hair
- W = Wollastonite
- OF = Other Fibers

**NON-FIBROUS MATERIALS**

- AM = Amphibole
- B = Binder
- CA = Carbonates
- CL = Clay
- F = Feldspar
- G = Gypsum
- HY = Hydromagnesite
- M = Miscellaneous
- MI = Mica
- OP = Opaque
- OR = Organic
- P = Perlite
- Q = Quartz
- T = Tar
- V = Vermiculite

**DISCLAIMER NOTES**

- "ND" indicates no asbestos was detected; the method detection limit is 0.25%.
- "Trace" or "<1" indicates asbestos was identified in the sample, but the concentration is less than the method quantitation limit of 0.25%. PLM coefficients of variance range from approximately 1.8 at the quantitation limit of 0.25% to 0.32 at high fiber concentrations.
- Samples are archived for three months following analysis and are then properly discarded.
- These results are submitted pursuant to RJ Lee Group's current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which these results are used or interpreted.
- This test report relates to the items tested.
- This report is not valid unless it bears the name of a NVLAP-approved signatory.
- Any reproduction of this document must be in full in order for the report to be valid.
- This report may not be used to claim product endorsement by NVLAP, any agency of the U.S. Government or any other laboratory accrediting agency.
- Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar nonfriable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as "non-asbestos-containing."
- Sample(s) for this project were analyzed at our: Monroeville, PA (AIHA #100364) facility.
- If RJ Lee Group, Inc. did not collect the samples analyzed, the verifiability of the laboratorys results are limited to the reported values.

<sup>1</sup> All samples listed were analyzed, individually, using ABA and NAG methods and were then composited, by lithotype, and used in the 2015 HCTs. The exception being *Yne*, which was not subjected to kinetic tests, but rather composited and tested using the SPLP

<sup>2</sup> Tintina geologists provided a dataset of *Ynl B* that is most relevant to the area of proposed workings, to improve sample selection. These averages are from a dataset of n=192, rather than the larger, regional dataset with n=1412.

<sup>3</sup> Intervals of the *Yc* contained either distinctly low-metal(iod) concentrations or high concentrations, and the overall dataset was relatively small, so strict adherence to the 20% margin was not possible. Subset samples were generated that reflected conservative values with

\* AP calculated with sulfide sulfur. NNP and NP:AP also recalculated.

\*\*Negative NP values (see lab reports) changed to "<1" for calculations and graphing. Affected NP:AP have also been controled with a reporting limit of "<0.01"

Red text indicates a "less than" method detection limit value

PAG, based on NP:AP <1, NAG <4.5, or both

Uncertain based on NP:AP between 1 and 3, and/or discrepancy between two ratings

NAG, based on NP:AP>3, NAG >4.5, or both

FND- 02	Find Sample for Addn Analysis
WEI- 25	Wt. of Crushed Reject

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
S- IR08	Total Sulphur (Leco)	LECO
OA- ELE07	Paste pH	
S- CAL06	Sulfide Sulfur (calculated)	LECO
S- GRA06	Sulfate Sulfur- carbonate leach	WST- SEQ
S- GRA06a	Sulfate Sulfur (HCl leachable)	WST- SEQ
OA- VOL11	Static Net Acid Generation	
OA- VOL08m	Modified NP	

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim 'or deposit has been determined based on the results of assays of multiple samples of geological materials collected by the prospective investor or by a qualified person selected by him/her and based on an evaluation of all engineering data which is available concerning any proposed project. Statement required by Nevada State Law NRS 519

**CERTIFICATE RE15061162**

Project: Black Butte Copper Project

This report is for 18 Drill Core samples submitted to our lab in Reno, NV, USA on 27- APR- 2015.

The following have access to data associated with this certificate:

JACK COTE KATERINE SEIPEL	LISA KIRK JERRY ZIEG	VINCE SCARTOZZI
------------------------------	-------------------------	-----------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
CRU- 22c	Crush entire sample > 70% - 19 mm
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WEI- 21	Received Sample Weight
WEI- 25	Wt. of Crushed Reject

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
S- IR08	Total Sulphur (Leco)	LECO
OA- ELE07	Paste pH	
S- CAL06	Sulfide Sulfur (calculated)	LECO
S- GRA06	Sulfate Sulfur- carbonate leach	WST- SEQ
S- GRA06a	Sulfate Sulfur (HCl leachable)	WST- SEQ
OA- VOL11	Static Net Acid Generation	
OA- VOL08m	Modified NP	

The results of this assay were based solely upon the content of the sample submitted. OA- VOL11	Static Net Acid Generation	
OA- VOL08m	Modified NP	

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim 'or deposit has been determined based on the results of assays of multiple samples of geological materials collected by the prospective investor or by a qualified person selected by him/her and based on an evaluation of all engineering data which is available concerning any proposed project. Statement required by Nevada State Law NRS 519

Project: Black Butte Copper Project

This report is for 20 Drill Core samples submitted to our lab in Reno, NV, USA on 13- MAR- 2015.

The following have access to data associated with this certificate:

JACK COTE KATERINE SEIPEL	LISA KIRK JERRY ZIEG	VINCE SCARTOZZI
------------------------------	-------------------------	-----------------

<b>SAMPLE PREPARATION</b>	
ALS CODE	DESCRIPTION
CRU- 22c	Crush entire sample > 70% - 19 mm
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WEI- 21	Received Sample Weight
WEI- 25	Wt. of Crushed Reject

<b>ANALYTICAL PROCEDURES</b>		
ALS CODE	DESCRIPTION	INSTRUMENT
S- IR08	Total Sulphur (Leco)	LECO
OA- ELE07	Paste pH	
S- CAL06	Sulfide Sulfur (calculated)	LECO
S- GRA06	Sulfate Sulfur- carbonate leach	WST- SEQ
S- GRA06a	Sulfate Sulfur (HCl leachable)	WST- SEQ
OA- VOL08	Basic Acid Base Accounting	
OA- VOL11	Static Net Acid Generation	
OA- VOL08m	Modified NP

# ANALYTICAL SUMMARY REPORT

June 22, 2015

Tintina Montana Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B15060680  
Project Name: Black Butte Copper

Energy Laboratories Inc Billings MT received the following 9 samples for Tintina Montana Inc on 6/5/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15060680-001	220479, SC12-108, 390.14-392		06/05/15	Soil	Soil Preparation
B15060680-002	220490, SC12-108, 410.5-412.5		06/05/15	Soil	Same As Above
B15060680-003	220492, SC12_108, 414.5-416.5		06/05/15	Soil	Same As Above
B15060680-004	220481, SC12_108, 394-396.5		06/05/15	Soil	Same As Above
B15060680-005	220491, SC12_108, 412.5-414.5		06/05/15	Soil	Same As Above
B15060680-006	220486, SC12-108, 402.5-404.5		06/05/15	Soil	Same As Above
B15060680-007	220466, SC11-036, 412-413.61		06/05/15	Soil	Same As Above
B15060680-008	220467, SC11-036, 413.61-414.41		06/05/15	Soil	Same As Above
B15060680-009	Yne-Comp		06/05/15	Soil	Metals by ICP/ICPMS, SPLP Composite Samples Mercury, SPLP pH, SPLP Digestion, Mercury by CVAA SPLP Extraction, Regular Digestion, Total Metals

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Sodium		35.6	mg/L	1.0	101	80	120	0.9	20		
<b>Lab ID: B15060680-009ADIL</b>	2	Serial Dilution								06/12/15 05:25	
Aluminum		6.05	mg/L	0.055		0	0	0.2	10		
Sodium		21.1	mg/L	1.6		0	0	1.4	10		
<b>Lab ID: B15060680-009AMS3</b>	2	Sample Matrix Spike								06/12/15 05:28	
Aluminum		17.4	mg/L	0.030	452	75	125			S	
Sodium		44.5	mg/L	1.0	95	75	125				

- S = Spike recovery outside QC advisory limits. The recovery in the Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) was within QC advisory limits. This suggests that the Matrix Spike recovery is due to matrix interference.

**Qualifiers:**

RL - Analyte reporting limit.

ND - Not detected at the reporting limit.

S - Spike recovery outside of advisory limits.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

RE: Request for SPLP Analytical Testing  
 Black Butte Copper Project

Tintina plans to conduct a Synthetic Precipitation Leaching Procedure (SPLP) using EPA Method 1312 on a composite of the samples included in this shipment (Neihart Quartzite unit (Yne)). The 8 subsamples shown below in Table 1 of the following shipment should be used to build a single sample for SPLP testing. Each sub-sample is to be individually crushed to the size appropriate for SPLP testing (100 % passing a 3/8" mesh screen). Once crushing is complete the sub-samples are to be combined and homogenized to form one composite sample as shown in Table 1. Once this composite is assembled, the sample should be identified as "Yne-Comp," which will be used to identify the composite for all future testing. Please retain a 200 mg split of this composite for mineralogy and store any excess sample for possible further testing.

Table 1 Samples for Yne-Comp

Sample ID	Hole ID	From	To
220479	SC12-108	390.14	392
220490	SC12_108	410.5	412.5

Please report the results of SPLP testing (including a data file in Microsoft Excel format) to Lisa Kirk at the following email address: [lkirk@montana.com](mailto:lkirk@montana.com)

Copy Katie Seipel ([seipel.k@gmail.com](mailto:seipel.k@gmail.com)) and Lauren Bozeman ([lauren.enviromin@gmail.com](mailto:lauren.enviromin@gmail.com)) for all results and related correspondence.

Tintina Resources should be invoiced directly for this work.

**Asbestiform Mineral Characterization**

A representative 100 to 200 gram aliquot of this composite sample should be sealed in double zip-lock bags labeled with the composite identification (Yne-Comp). These samples are to be shipped to the RJ Lee Group for analysis of potentially asbestiform mineral content. Please ship these samples, under chain-of-custody with the attached analytical request, to the following address.

RE: Request for Sample Shipment to Energy Laboratories  
 Tintina Black Butte Copper Project

The following samples of the Neihart Quartzite from Tintina's Black Butte Copper Project have been archived at ALS Laboratories following previous testing (RE15016043 and RE15038031). **Table 1** includes the sample IDs for these samples. Please ship the indicated mass of reject with size greater than 100% passing a 3/8" mesh screen to Energy Laboratories in Billings, MT for further testing. **Table 1** indicates reject mass available at ALS Laboratories and the mass (in grams) of the split we are requesting to be sent to Energy Labs:

 RJ Lee Group Job No. AOH1037435-0  
 Authorization/P.O. No.  
 Client Job No./Name Black Butte Copper Project

Analysis: Asbestos in Bulk Samples by Point Count  
 Method: EPA/600/R-93/116

RJLG Sample Number	Client Sample Number	Homogeneous	# of Layers	Asbestos Detected(%)	Non-Asbestos Fibers(%)	Non-Fibrous Materials(%)	Matrix Material	Analyst - Analysis Date
10334740.HPL	Yne-Comp	Yes	1	ND		100.00	Q, OP, M	LL-07/20/2015

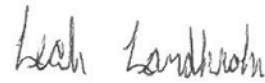

Description: Pink Crushed Rock  
 400 Points Counted for a Detection Limit of 0.25%. No Asbestiform Minerals Detected.

Weight Loss: 0.0%

Client Job No./Name: Black Butte Copper Project

RJ Lee Group Job No: AOH1037435-0

RJLG Sample Number	Client Sample Number	Homogeneous	# of Layers	Asbestos Detected(%)	Non-Asbestos Fibers(%)	Non-Fibrous Materials(%)	Matrix Material	Analyst - Analysis Date
--------------------	----------------------	-------------	-------------	----------------------	------------------------	--------------------------	-----------------	-------------------------

Authorized Signature: \_\_\_\_\_

Leah Landkrohn, Microscopist

**ASBESTOS**

- AM = Amosite
- AC = Actinolite
- AN = Anthophyllite
- CH = Chrysotile
- CR = Crocidolite
- TR = Tremolite

**NON-ASBESTOS**

- CE = Cellulose
- MW = Mineral Wool
- FG = Fibrous Glass
- SF = Synthetic Fibers
- H = Hair
- W = Wollastonite
- OF = Other Fibers

**NON-FIBROUS MATERIALS**

- AM = Amphibole
- B = Binder
- CA = Carbonates
- CL = Clay
- F = Feldspar
- G = Gypsum
- HY = Hydromagnesite
- M = Miscellaneous
- MI = Mica
- OP = Opaque
- OR = Organic
- P = Perlite
- Q = Quartz
- T = Tar
- V = Vermiculite

**DISCLAIMER NOTES**

- "ND" indicates no asbestos was detected; the method detection limit is 0.25%.
- "Trace" or "<" indicates asbestos was identified in the sample, but the concentration is less than the method quantitation limit. PLM coefficients of variance range from approximately 1.8 at the quantitation limit of 0.25% to 0.32 at high fiber concentrations.
- Samples are archived for three months following analysis and are then properly discarded.
- These results are submitted pursuant to RJ Lee Group's current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which these results are used or interpreted.
- This test report relates to the items tested.
- This report is not valid unless it bears the name of a NVLAP Lab Code 101208-0 approved signatory.
- Any reproduction of this document must be in full in order for the report to be valid.
- This report may not be used to claim product endorsement by NVLAP Lab Code 101208-0, any agency of the U.S. Government or any other laboratory accrediting agency.
- Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar nonfriable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as "non-asbestos-containing."
- Sample(s) for this project were analyzed at our: Monroeville, PA (AIHA #100364) facility.
- If RJ Lee Group, Inc. did not collect the samples analyzed, the verifiability of the laboratorys results are limited to the reported values.

<sup>1</sup> Surface Water standards are the lowest available, which in most cases in the "chronic aquatic life" criteria. Hardness-dependent criteria have been adjusted for a site hardness of 130 mg/L.

<sup>2</sup> *Italicized* MDL (Method Detection Limit) values indicate that the limit used by the lab differs from the Required Reporting Limit (RRL). Discrepancies between MDLs and RRLs include: Cadmium (MDL=0.0003 mg/L, RLL=0.008 mg/L); Chromium (MDL=0.01 mg/L, RRL=0.002 mg/L); Mercury (MDL=0.00001 mg/L, RRL=0.000005 mg/L); Phosphorus (MDL=0.005 mg/L, RRL=0.001 mg/L); and Uranium (MDL=0.0002 mg/L, RRL=0.00002 mg/L).

<sup>3</sup> In weeks 0 and 72, the laboratory used a method detection limit of 0.000005 mg/L for Mercury.

GW= Ground water, SW= Surface water, MDL=Required Reporting Limit.

Pink highlighted cells indicate surface water quality exceedances and blue highlighted cells indicate ground water quality exceedances.

Red values indicate values below the detection limit

<sup>1</sup> Surface Water standards are the lowest available, which in most cases in the "chronic aquatic life" criteria. Hardness-dependent criteria have been adjusted for a site hardness of 130 mg/L.

<sup>2</sup> *Italicized* MDL (Method Detection Limit) values indicate that the limit used by the lab differs from the Required Reporting Limit (RRL). Discrepancies between MDLs and RRLs include: Cadmium (MDL=0.0003 mg/L, RRL=0.008 mg/L); Chromium (MDL=0.01 mg/L, RRL=0.002 mg/L); Mercury (MDL=0.00001 mg/L, RRL=0.00005 mg/L); Phosphorus (MDL=0.005 mg/L, RRL=0.001 mg/L); and Uranium (MDL=0.0002 mg/L, RRL=0.00002 mg/L).

<sup>3</sup> In weeks 0 and 72, the laboratory used a method detection limit of 0.000005 mg/L for Mercury.

GW= Ground water, SW= Surface water, MDL=Required Reporting Limit, <sup>4</sup>Value not reported.

Pink highlighted cells indicate surface water quality exceedances and blue highlighted cells indicate ground water quality exceedances.

Red values indicate values below the detection limit

<sup>1</sup> Surface Water standards are the lowest available, which in most cases in the "chronic aquatic life" criteria. Hardness-dependent criteria have been adjusted for a site hardness of 130 mg/L.

<sup>2</sup> *Italicized* MDL (Method Detection Limit) values indicate that the limit used by the lab differs from the Required Reporting Limit (RRL). Discrepancies between MDLs and RRLs include: Cadmium (MDL=0.0003 mg/L, RRL=0.008 mg/L); Chromium (MDL=0.01 mg/L, RRL=0.002 mg/L); Mercury (MDL=0.00001 mg/L, RRL=0.000005 mg/L); Phosphorus (MDL=0.005 mg/L, RRL=0.001 mg/L); and Uranium (MDL=0.0002 mg/L, RRL=0.00002 mg/L).

<sup>3</sup> In weeks 0 and 72, the laboratory used a method detection limit of 0.000005 mg/L for Mercury, <sup>4</sup> Value not reported.

GW= Ground water, SW= Surface water, MDL=Required Reporting Limit.

Pink highlighted cells indicate surface water quality exceedances and blue highlighted cells indicate ground water quality exceedances. Red values indicate values below the detection limit.

Table C-3. Summary of Weekly Data for 2015 HCT

	Week	Volume	Effluent pH	Redox Potential	Conductivity	Total Fe			Fe <sup>2+</sup>	Fe <sup>3+</sup>	SO <sub>4</sub> <sup>2-</sup>			Acidity, CaCO <sub>3</sub> Equivalents			Alkalinity, CaCO <sub>3</sub> Equivalents		
		L	s.u.	mV (vs Ag/AgCl)	µS/cm	mg/L	mg/kg	Cum. mg/kg	mg/L	mg/L	mg/L	mg/kg	Cum. mg/kg	mg/L	mg/kg	Cum. mg/kg	mg/L	mg/kg	Cum. mg/kg

<sup>1</sup> Surface Water standards are the lowest available, which in most cases in the "chronic aquatic life" criteria. Hardness-dependent criteria have been adjusted for a site hardness of 130 mg/L.

<sup>2</sup> *Italicized* MDL (Method Detection Limit) values indicate that the limit used by the lab differs from the Required Reporting Limit (RRL). Discrepancies between MDLs and RRLs include: Cadmium (MDL=0.0003 mg/L, RRL=0.008 mg/L); Chromium (MDL=0.01 mg/L, RRL=0.002 mg/L); Mercury (MDL=0.00001 mg/L, RRL=0.000005 mg/L); Phosphorus (MDL=0.005 mg/L, RRL=0.001 mg/L); and Uranium (MDL=0.0002 mg/L, RRL=0.00002 mg/L).

GW= Ground water, SW= Surface water, MDL=Required Reporting Limit, Red values indicate values below the detection limit.

Pink highlighted cells indicate surface water quality exceedances and blue highlighted cells indicate ground water quality exceedances.

<sup>1</sup> Surface Water standards are the lowest available, which in most cases in the “chronic aquatic life” criteria. Hardness-dependent criteria have been adjusted for a site hardness of 130 mg/L.

<sup>2</sup> *Italicized MDL (Method Detection Limit) values indicate that the limit used by the lab differs from the Required Reporting Limit (RRL). Discrepancies between MDLs and RRLs include: Cadmium (MDL=0.0003 mg/L, RRL=0.008 mg/L); Chromium (MDL=0.01 mg/L, RRL=0.002 mg/L); Mercury (MDL=0.00001 mg/L, RRL=0.000005 mg/L); Phosphorus (MDL=0.005 mg/L, RRL=0.001 mg/L); and Uranium (MDL=0.0002 mg/L, RRL=0.00002 mg/L).*

GW= Ground water, SW= Surface water, MDL=Required Reporting Limit, **Red values** indicate values below the detection limit.

Pink highlighted cells indicate surface water quality exceedances and blue highlighted cells indicate ground water quality exceedances.

<sup>1</sup> Surface Water standards are the lowest available, which in most cases in the "chronic aquatic life" criteria. Hardness-dependent criteria have been adjusted for a site hardness of 130 mg/L.

<sup>2</sup> *Italicized* MDL (Method Detection Limit) values indicate that the limit used by the lab differs from the Required Reporting Limit (RRL). Discrepancies between MDLs and RRLs include: Cadmium (MDL=0.0003 mg/L, RRL=0.008 mg/L); Chromium (MDL=0.01 mg/L, RRL=0.002 mg/L); Mercury (MDL=0.00001 mg/L, RRL=0.000005 mg/L); Phosphorus (MDL=0.005 mg/L, RRL=0.001 mg/L); and Uranium (MDL=0.0002 mg/L, RRL=0.00002 mg/L).

GW= Ground water, SW= Surface water, MDL=Required Reporting Limit, Red values indicate values below the detection limit.

Pink highlighted cells indicate surface water quality exceedances and blue highlighted cells indicate ground water quality exceedances.

Dear Lisa:

Enclosed is our report concerning results obtained from humidity cell (HC) kinetic acid rock drainage (ARD) potential tests conducted on four samples for the Black Butte Copper 2012 Johnny Lee Decline Project.

We appreciate the opportunity to serve you and Tintina Resources on this project.

Sincerely,

Michael Medina  
Environmental Project Manager

Bozeman, MT 59717**

**EXECUTIVE SUMMARY**

A total of 4 samples, designated USZ 1 high Fe/USZ 2 low Fe composite (USZ 1/USZ 2 Composite), Ynl 0, Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline were received on 12/14/12 for ICP metals analysis (4 acid digestion) and HC kinetic ARD potential testing.

HC kinetic ARD potential tests (ASTM D5744-07, Option A) were conducted on a 2.0 kg split of each sample to assess potential of the solids to generate or neutralize acid in a natural weathering and oxidizing environment. The testing duration was 24 weeks for the USZ 1/USZ 2 Composite and Ynl 0 samples, 88 weeks for the Ynl 1/Ynl 2 Composite sample and 62 weeks for the Ynl B 2012 Decline sample.

HC kinetic ARD potential test results show that the USZ 1/USZ 2 Composite, Ynl 0, Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline samples would not produce acid in a natural environment. Specific results are summarized as follows:

**USZ 1/USZ 2 Composite**

- Extract pH was alkaline the majority of the test duration and ranged from pH 5.95 (week 0) to 7.38 (week 12). Week 24 extract pH was 7.28.
- Redox potential was oxidizing, ranged from -11 (week 6) to 257 (week 5) mV and was typical of solid/solution systems exposed to air.
- Conductivity values were fairly stable and ranged from 828 (week 19) to 2,090 (week 1)  $\mu\text{S/cm}$ .
- Iron mobility (dissolution) was minimal. Sulfate mobility was moderate and decreasing throughout the test.
- Acidity was not detected in any weekly extract after week 2.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 9 (week 2) to 25 (week 18)  $\text{mgCaCO}_3/\text{L}$ .

### **Ynl 0**

- Extract pH was alkaline the duration of the test and ranged from pH 7.46 (week 17) to 9.19 (week 0). Week 24 extract pH was 7.74.
- Redox potential was oxidizing, ranged from 7 (week 0) to 197 (week 17) mV, and was typical of solid/solution systems exposed to air.
- Conductivity values were low, stable, and ranged from 62 (week 17) to 240 (week 1)  $\mu\text{S}/\text{cm}$ .
- Iron and sulfate mobility (dissolution) was minimal.
- Acidity was not detected in any weekly extract.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 16 (week 17) to 42 (week 0)  $\text{mgCaCO}_3/\text{L}$ .

### **Ynl 1/Ynl 2 Composite**

- Extract pH was alkaline the majority of the test duration and ranged from pH 6.77 (week 0) to 7.75 (week 55). Week 88 extract pH was 7.36.
- Redox potential was oxidizing, ranged from -37 (week 0) to 412 (week 88) mV and was typical of solid/solution systems exposed to air.
- Conductivity values were low, fairly stable, and ranged from 232 (week 19) to 1,100 (week 1)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was minimal. Sulfate mobility was fairly low and decreasing the last 10 weeks of testing
- Acidity was only detected in 16 weekly extracts and was never above 4  $\text{mgCaCO}_3/\text{L}$ .
- Alkalinity was detected in all weekly extracts and concentrations ranged from 12 (week 20) to 53 (week 0)  $\text{mgCaCO}_3/\text{L}$ .

### **Ynl B 2012 Decline**

- Extract pH was alkaline the duration of the test and ranged from pH 7.27 (week 54) to 8.66 (week 0). Week 62 extract pH was 7.69.
- Redox potential was oxidizing, ranged from 20 (week 57) to 335 (week 40) mV, and was typical of solid/solution systems exposed to air.
- Conductivity values were low, fairly stable, and ranged from 120 (week 6) to 690 (week 17)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was minimal. Sulfate mobility was fairly low and stable.
- Acidity was not detected in any weekly extract.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 18 (week 42) to 47 (week 54)  $\text{mgCaCO}_3/\text{L}$ .

Constituent mobility during the HCT was minimal from the USZ 1/USZ 2 Composite, Ynl 0, Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline samples, likely because acid was not produced during kinetic ARD testing.

**SAMPLE PREPARATION AND FEED ANALYSES**

All samples were received at a -1/4" feed size. Samples were individually blended and split (rotary splitter) to obtain 2.0 kg for humidity cell testing and 0.10 kg for ICP metals analysis. Splits for ICP metals analysis were submitted to ALS.

ICP metals analysis results are provided in Table 1. The ALS report is provided in the Appendix to this report.

## **HC KINETIC ARD POTENTIAL TEST PROCEDURE AND RESULTS**

Modified HC kinetic ARD potential tests were conducted on 1.9954 kg, 2.0145 kg, 2.0080 kg and 1.9951 kg splits of the USZ 1/USZ 2 Composite, Ynl 0, Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline samples (respectively) at the as received feed size (-1/4") to assess potential of the solids to generate or neutralize acid in an aggressive and accelerated weathering and oxidizing environment. The ASTM standard procedure (D5744-07, Option A) was employed the duration of the kinetic testing. The testing duration was 24 weeks (25 with week 0) for the USZ 1/USZ 2 Composite and Ynl 0 samples, 88 weeks (89 with week 0) for the Ynl 1/Ynl 2 Composite sample and 62 weeks (63 with week 0) for the Ynl B 2012 Decline sample.

The HC tests were conducted for 24+ weeks in seven day cycles. After initial saturation (week 0), dry, filtered compressed air was passed upwards through the solids charge the first three days of the cycle. Humidified air, generated by sparging filtered compressed air into deionized water (DI H<sub>2</sub>O, pH 5.5) contained in a temperature controlled (30° C) vessel, was passed upwards through the charge the next three days of the cycle. On the seventh day, the charge was saturated (flooded) with DI H<sub>2</sub>O and allowed to soak for one hour. After soaking, effluent was allowed to percolate through and drain freely from the solids charge. Effluent was collected in a sealed container and volume was measured by weighing (1 L/week applied - 1.5 L applied for week 0). Unfiltered, unpreserved effluent samples were analyzed immediately for redox potential (Ag/AgCl reference), pH, EC, SO<sub>4</sub><sup>-</sup>, acidity and alkalinity. Separate effluent samples (50 mL) were filtered through a 0.45µm filter to produce extract. Those extracts were analyzed immediately for Fe, Fe<sup>2+</sup> and Fe<sup>3+</sup> (by difference). Remaining weekly effluents were filtered (0.45µm), appropriately preserved and shipped to Energy Labs for the Montana suite of constituent analyses. Single-use, disposable filters were used for all extracts. Weeks 0, 1, 2, 4, 8, 12, 16, 20, 24 and every 4<sup>th</sup> week thereafter (where applicable) extracts (not composites) were submitted for detailed metals analysis. Interim mineralogy splits (50 g) were taken from the Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline humidity cell samples after 32 weeks of testing.

HC test data for the USZ 1/USZ 2 Composite, Ynl 0, Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline samples are provided in Table 2, 3, 4 and 5, respectively. Figures 1 (a and b), 2 (a and b), 3 (a and b) and 4 (a and b) which follow Table 2, 3, 4 and 5 respectively, depict graphically, on a weekly (a figure) and cumulative (b figure) mass basis, analytical data for pH, SO<sub>4</sub>, acidity and alkalinity. Energy Labs report sheets for metals analyses on extracts are provided in the Appendix to this report.

<sup>1)</sup> Conductivity originally reported in mS/cm. Reported in  $\mu\text{S/cm}$  after week 12.  
Testing terminated after week 62

**Table 5. - Humidity Cell Analytical Results, Ynl B 2012 Decline (1.9951 kg)**

Week	Vol. L	Effluent pH	Redox, mV (vs Ag/AgCl)	Conductivity $\mu\text{S}/\text{cm}^1$	Total Fe			$\text{Fe}^{2+}$ mg/l	$\text{Fe}^{3+}$ mg/l	$\text{SO}_4^{=}$		Acidity, $\text{CaCO}_3$ Equivalents			Alkalinity, $\text{CaCO}_3$ Equivalents		
					mg/l	mg/kg	Cum. mg/kg			mg/l	mg/kg	Cum. mg/kg	mg/l	mg/kg	Cum. mg/kg	mg/l	mg/kg

HC kinetic ARD potential test data demonstrate that the USZ 1/USZ 2 Composite, Ynl 0, Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline samples would not generate acid in a natural weathering and oxidizing environment. The acid neutralizing nature of the tested sample is demonstrated by the data summary below.

### **USZ 1/USZ 2 Composite**

- Extract pH was basic (alkaline) and was fairly stable the majority of the test duration. Extract pH ranged from pH 5.95 (week 0) to pH 7.38 (week 12).
- Redox potential was oxidizing and ranged from -11 (week 6) to 257 (week 5) mV. This range of oxidizing potential is typical of solid/solution systems exposed to air, but was never at the oxidizing level (> 450 mV) to indicate oxidation of sulfide minerals.
- Conductivity values were low and fairly constant during the kinetic test, and ranged from 828 (week 19) to 2090 (week 1)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was slight. Week 0 extract concentration was 101.50 mg/L. Iron concentration decreased rapidly after week 0 and concentrations were <0.01 mg/L for multiple weeks.
- Sulfate mobility was moderate. Week 0 extract concentration was 1140 mgSO<sub>4</sub>/L. Sulfate concentration decreased gradually after week 0 and week 24 concentration was 340.0 mg/L. Only 1.68 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was not detected in any weekly extract after week 2.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 9 (week 2) to 25 (week 18) mgCaCO<sub>3</sub> equivalents/L. Maximum available alkalinity in the USZ 1/USZ 2 Composite was 260,000 mg/kg, but only 217.40 mgCaCO<sub>3</sub>/kg was consumed (0.08% of total) during the HCT.

### **Ynl 0**

- Extract pH was basic (alkaline) and was fairly stable the duration of the HCT. Extract pH ranged from pH 7.46 (week 17) to pH 9.19 (week 0).
- Redox potential was oxidizing and ranged from 7 (week 0) to 197 (week 17) mV. This range of oxidizing potential is typical of solid/solution systems exposed to air, but was never at the oxidizing level (> 450 mV) to indicate oxidation of sulfide minerals.
- Conductivity values were low and fairly constant during the kinetic test, and ranged from 62 (week 17) to 240 (week 1)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was slight and the highest Fet concentration was 0.15 mg/L (week 1).
- Sulfate mobility was also slight with the highest concentration being 78.0 mgSO<sub>4</sub>/L. Only 2.60 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was not detected in any weekly extract.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 16 (week 17) to 42 (week 0) mgCaCO<sub>3</sub> equivalents/L. Maximum available alkalinity in the Ynl 0 sample was 761,000 mg/kg, but only 274.44 mgCaCO<sub>3</sub>/kg was consumed (0.04% of total) during the HCT.

### **Ynl 1/Ynl 2 Composite**

- Extract pH was basic (alkaline) and was fairly stable the majority of the test duration. Extract pH ranged from pH 6.77 (week 0) to pH 7.75 (week 55).
- Redox potential was oxidizing and ranged from -37 (week 0) to 412 (week 88) mV. This range of oxidizing potential is typical of solid/solution systems exposed to air, but was never at the oxidizing level (> 450 mV) to indicate oxidation of sulfide minerals.
- Conductivity values were low and fairly constant during the kinetic test, and ranged from 232 (week 19) to 1,100 (week 1)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was slight. Week 0 extract concentration was 9.00 mg/L. Iron concentration decreased rapidly after week 0 and concentrations were generally <0.10 mg/L for the duration of testing.
- Sulfate mobility was fairly low. Week 0 extract concentration was 600 mgSO<sub>4</sub>/L. Sulfate concentration increased after week 24 and then gradually decreased throughout the duration of the testing. Only 17.26 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was only detected in 16 weekly extracts and was never above 4 mgCaCO<sub>3</sub>/L.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 12 (week 20) to 53 (week 0) mgCaCO<sub>3</sub> equivalents/L. Maximum available alkalinity in the Ynl 1/Ynl 2 Composite was 263,000 mg/kg, but only 824.50 mgCaCO<sub>3</sub>/kg was consumed (0.31% of total) during the HCT.

### **Ynl B 2012 Decline**

- Extract pH was basic (alkaline) and was fairly stable the duration of the HCT. Extract pH ranged from pH 7.27 (week 54) to pH 8.66 (week 0).
- Redox potential was oxidizing and ranged from 102 (week 6) to 335 (week 40) mV. This range of oxidizing potential is typical of solid/solution systems exposed to air, but was never at the oxidizing level (> 450 mV) to indicate oxidation of sulfide minerals.
- Conductivity values were low and fairly constant during the kinetic test, and ranged from 120 (week 6) to 690 (week 17)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was slight and was <0.10 mg/L for the duration of testing.
- Sulfate mobility was fairly low. Sulfate concentration increased gradually after week 0 to a high of 350.0 mg/L (week 16). Sulfate concentration then decreased gradually through week 31 and leveled off. Only 9.43 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was not detected in any weekly extract.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 18 (week 42) to 47 (week 54) mgCaCO<sub>3</sub> equivalents/L. Maximum available alkalinity in the Ynl B 2012 Decline sample was 333,000 mg/kg, but only 862.14 mgCaCO<sub>3</sub>/kg was consumed (0.26% of total) during the HCT.

Table 6 provides maximum available acidity, sulfate and alkalinity in the USZ 1/USZ 2 Composite, Ynl 0, Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline samples, on a mass basis, and those component dissolutions (mass basis) during the HC kinetic ARD potential test. Maximum availability data obtained from Mod ABA static ARD potential testing results provided by Enviromin, Inc.

**Table 6. - Comparative Static and Kinetic ARD Test Acidity, Sulfate, and Alkalinity Generation (Dissolution) Data, -1/4" Feed Size**

Sample I.D.	Acidity, mg/kg			Sulfate, mg/kg			Alkalinity, mg/kg		
	Max. from Solids <sup>1)</sup>	Generated		Max. from Solids <sup>2)</sup>	Generated		Max. from Solids <sup>3)</sup>	Generated	
		HC Test	Pct. of Total		HC Test	Pct. of Total		HC Test	Pct. of Total
USZ 1/USZ 2 Comp	541,000	103.85	0.02	459,300	7,735.77	1.68	260,000	217.40	0.08
Ynl 0	10,000	0.00	0.00	9,300	241.78	2.60	761,000	274.44	0.04
Ynl 1/Ynl 2 Comp	76,000	25.76	0.03	70,500	12,169.70	17.26	263,000	824.50	0.31
Ynl B 2012 Decline	41,000	0.00	0.00	38,700	5,291.39	9.43	333,000	862.14	0.26

1) AGP (tons CaCO<sub>3</sub>/1000 tons) x 1000.

2) Total S as SO<sub>4</sub><sup>2-</sup> converted from weight percent to mg/kg.

3) ANP (tons CaCO<sub>3</sub>/1000 tons) x 1000.

Mass data demonstrate that, for most constituents, only small percentages of acidity, sulfate and alkalinity contained in the feeds were generated during the HC tests.

Constituent analysis results for selected weekly extracts are provided in Tables 7, 8, 9 and 10.

Extract analysis results show that constituent (metals) mobility was minimal during the kinetic HCT. Some metals concentrations may have exceeded chronic aquatic limits in week 0 extracts, but with the exception of Tl for the USZ 1/USZ 2 Composite sample, metals concentrations dropped off after the initial flush.

## RESIDUE ANALYSIS

After testing , the USZ 1/USZ 2 Composite, Ynl 1/Ynl 2 Composite, and Ynl B 2012 Decline samples had splits taken from the humidity cell residue for size fraction, ICP metals, and ABA analyses. Samples were air dried and then individually blended and split (rotary splitter) to obtain appropriate splits for analysis.

Splits for ICP metals analysis were submitted to ALS. Splits for Mod ABA analysis were submitted to SVL Analytical, Inc.

Size fraction screen analysis results are provided in Tables 11 through 13. Mod ABA analysis results are provided in Table 14. The SVL Analytical report is provided in the Appendix to this report. ICP metals analysis results are provided in Table 15. The ALS report is provided in the Appendix to this report.

## CONCLUSIONS

- USZ 1/USZ 2 Composite, Ynl 0, Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline samples would not produce acid in a natural weathering and oxidizing environment.
- Constituent (metals) mobility was minimal.

Michael Medina  
Environmental Project Manager

# ANALYTICAL SUMMARY REPORT

January 17, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13010272      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:0

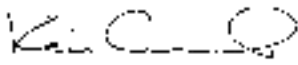

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Alaska Exploration Inc on 1/4/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13010272-001	USZ 1 High Fe/USZ 2 Low Fe Composite	01/03/13 9:00	01/04/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13010272-002	Ynl 0	01/03/13 9:00	01/04/13	Aqueous	Same As Above
B13010272-003	Ynl 1/Ynl 2 Composite	01/03/13 9:00	01/04/13	Aqueous	Same As Above
B13010272-004	Ynl B 2012 Decline	01/03/13 9:00	01/04/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

January 21, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13010867      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:1

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Alaska Exploration Inc on 1/11/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13010867-001	USZ 1 High Fe/USZ 2 Low Fe Composite	01/10/13 9:00	01/11/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13010867-002	Ynl 0	01/10/13 9:00	01/11/13	Aqueous	Same As Above
B13010867-003	Ynl 1/Ynl 2 Composite	01/10/13 9:00	01/11/13	Aqueous	Same As Above
B13010867-004	Ynl B 2012 Decline	01/10/13 9:00	01/11/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

February 12, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13020022      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:4

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Alaska Exploration Inc on 2/1/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13020022-001	USZ 1 High Fe/USZ 2 Low Fe Composite	01/31/13 9:00	02/01/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13020022-002	Ynl 0	01/31/13 9:00	02/01/13	Aqueous	Same As Above
B13020022-003	Ynl 1/Ynl 2 Composite	01/31/13 9:00	02/01/13	Aqueous	Same As Above
B13020022-004	Ynl B 2012 Decline	01/31/13 9:00	02/01/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

March 12, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13030044      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:8

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Alaska Exploration Inc on 3/1/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13030044-001	USZ 1 High Fe/USZ 2 Low Fe Composite	02/28/13 9:00	03/01/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13030044-002	Ynl 0	02/28/13 9:00	03/01/13	Aqueous	Same As Above
B13030044-003	Ynl 1/Ynl 2 Composite	02/28/13 9:00	03/01/13	Aqueous	Same As Above
B13030044-004	Ynl B 2012 Decline	02/28/13 9:00	03/01/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

B13032186

April 11, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13032186                      Quote ID: B2868 - Tintina Project

Project Name: 3767 WK:12

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Alaska Exploration Inc on 3/29/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13032186-001	USZ 1 High Fe/USZ 2 Low Fe Composite	03/28/13 9:00	03/29/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13032186-002	Ynl 0	03/28/13 9:00	03/29/13	Aqueous	Same As Above
B13032186-003	Ynl 1/Ynl 2 Composite	03/28/13 9:00	03/29/13	Aqueous	Same As Above
B13032186-004	Ynl B 2012 Decline	03/28/13 9:00	03/29/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

Sulfate		1650	mg/L	2.1		90	110	0.3	20	A

**Qualifiers:**

RL - Analyte reporting limit.

ND - Not detected at the reporting limit.

A - The analyte level was greater than four times the spike level. In accordance with the method % recovery is not calculated.

S - Spike recovery outside of advisory limits.

# QA/QC Summary Report

ND - Not detected at the reporting limit.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

Contact and Corrective Action Comments:

Sample YNL1/YNL2 for Metals was received at pH ~4. 2 mL of nitric acid was added in the laboratory to preserve to pH<2. In accordance with the Clean Water Act, this Metals sample must be held for 24 hour prior to analysis.

# ANALYTICAL SUMMARY REPORT

October 02, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13091213      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:36

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Alaska Exploration Inc on 9/13/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13091213-001	Ynl 1/Ynl 2 Composite	09/12/13 9:00	09/13/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13091213-002	Ynl B 2012 Decline	09/12/13 9:00	09/13/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

Zinc	0.010	mg/L		0.008		E200.8	09/16/13 17:22 / jjw

**Report Definitions:**  
RL - Analyte reporting limit.  
QCL - Quality control limit.  
D - RL increased due to sample matrix.

MCL - Maximum contaminant level.  
ND - Not detected at the reporting limit.  
L - Lowest available reporting limit for the analytical method used.

### Qualifiers:

RL - Analyte reporting limit.

ND - Not detected at the reporting limit.

# Standard Reporting Procedures

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

October 24, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13101177      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:40

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Alaska Exploration Inc on 10/11/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13101177-001	Ynl 1/Ynl 2 Composite	10/10/13 9:00	10/11/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13101177-002	Ynl B 2012 Decline	10/10/13 9:00	10/11/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

November 13, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13110762      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:44

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Alaska Exploration Inc on 11/8/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13110762-001	Ynl 1/Ynl 2 Composite	11/07/13 9:00	11/08/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13110762-002	Ynl B 2012 Decline	11/07/13 9:00	11/08/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

---

## Contact and Corrective Action Comments:

Samples for Dissolved Total Phosphorus were received at pH ~ 5. 2 mL of sulfuric was added in the laboratory to each sample to preserve to pH<2.

## ANALYTICAL SUMMARY REPORT

December 12, 2013

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B13120511                      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:48

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Alaska Exploration Inc on 12/6/2013 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B13120511-001	Ynl 1/Ynl 2 Composite	12/05/13 9:00	12/06/13	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B13120511-002	Ynl B 2012 Decline	12/05/13 9:00	12/06/13	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

None

# ANALYTICAL SUMMARY REPORT

January 09, 2014

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B14010135      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:52

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Alaska Exploration Inc on 1/3/2014 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14010135-001	Ynl 1/Ynl 2 Composite	01/02/14 9:00	01/03/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B14010135-002	Ynl B 2012 Decline	01/02/14 9:00	01/03/14	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Zinc	0.010	mg/L		0.008		E200.8	01/06/14 15:36 / amm

**Report Definitions:**  
 RL - Analyte reporting limit.  
 QCL - Quality control limit.  
 L - Lowest available reporting limit for the analytical method used.

MCL - Maximum contaminant level.  
 ND - Not detected at the reporting limit.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

Samples Ynl 1/Ynl 2 Composite and Ynl B 2012 Decline for Dissolved Phosphorus was received at pH ~ 6. 2 mL of sulfuric acid was added in the laboratory to preserve to pH<2.

# ANALYTICAL SUMMARY REPORT

February 07, 2014

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B14012000      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:56

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Alaska Exploration Inc on 1/31/2014 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14012000-001	YnL 1/YnL 2 Composite	01/30/14 9:00	01/31/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B14012000-002	YnL B 2012 Decline	01/30/14 9:00	01/31/14	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

March 05, 2014

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Workorder No.: B14021785      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:60

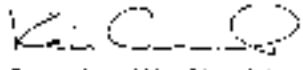

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Alaska Exploration Inc on 2/28/2014 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14021785-001	Ynl 1/Ynl 2 Composite	02/27/14 9:00	02/28/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B14021785-002	Ynl B 2012 Decline	02/27/14 9:00	02/28/14	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

Digitally signed by

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

---

## Contact and Corrective Action Comments:

None

# ANALYTICAL SUMMARY REPORT

April 09, 2014

Tintina Alaska Exploration Inc  
PO Box 49073  
Vancouver, BC V7X1G4

Work Order: B14032166      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:64

Energy Laboratories Inc Billings MT received the following 1 sample for Tintina Alaska Exploration Inc on 3/28/2014 for analysis.

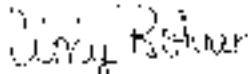

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14032166-001	Ynl 1/Ynl 2 Composite	03/27/14 9:00	03/28/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

May 02, 2014

Tintina Alaska Exploration Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B14042300      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:68

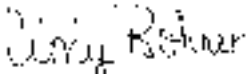

Energy Laboratories Inc Billings MT received the following 1 sample for Tintina Alaska Exploration Inc on 4/25/2014 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14042300-001	Ynl 1/Ynl 2 Composite	04/24/14 9:00	04/25/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:

Chain of custody present?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody signed when relinquished and received?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody agrees with sample labels?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Samples in proper container/bottle?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample containers intact?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sufficient sample volume for indicated test?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
All samples received within holding time? (Exclude analyses that are considered field parameters such as pH, DO, Res Cl, Sulfite, Ferrous Iron, etc.)	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Temp Blank received in all shipping container(s)/cooler(s)?	Yes <input type="checkbox"/>	No <input checked="" type="checkbox"/>	Not Applicable <input type="checkbox"/>
Container/Temp Blank temperature:	5.6°C On Ice		
Water - VOA vials have zero headspace?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	No VOA vials submitted <input checked="" type="checkbox"/>
Water - pH acceptable upon receipt?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	Not Applicable <input type="checkbox"/>

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

---

# ANALYTICAL SUMMARY REPORT

June 02, 2014

Tintina Alaska Exploration Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B14052147      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:72

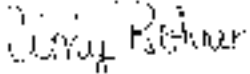

Energy Laboratories Inc Billings MT received the following 1 sample for Tintina Alaska Exploration Inc on 5/23/2014 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14052147-001	Ynl 1/Ynl 2 Composite	05/22/14 9:00	05/23/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Laboratory Co-Manager

Digitally signed by

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

None

Vancouver, BC V6C 1S4

Work Order: B14061973      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:76

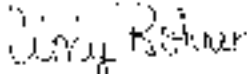

Energy Laboratories Inc Billings MT received the following 1 sample for Tintina Alaska Exploration Inc on 6/20/2014 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14061973-001	Ynl 1/Ynl 2 Composite	06/19/14 9:00	06/20/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

Energy Laboratories Inc Billings MT received the following 1 sample for Tintina Alaska Exploration Inc on 7/18/2014 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14071768-001	Ynl 1/Ynl 2 Composite	07/17/14 9:00	07/18/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

**Report Definitions:**  
 RL - Analyte reporting limit.  
 QCL - Quality control limit.  
 L - Lowest available reporting limit for the analytical method used.

MCL - Maximum contaminant level.  
 ND - Not detected at the reporting limit.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

September 11, 2014

Tintina Alaska Exploration Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B14081625      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:84

Energy Laboratories Inc Billings MT received the following 1 sample for Tintina Alaska Exploration Inc on 8/15/2014 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14081625-001	Ynl 1/Ynl 2 Composite	08/14/14 9:00	08/15/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

**Work Order:** B14081625

**Revised Date:** 09/11/14

**Report Date:** 08/26/14

## CASE NARRATIVE

Per request from Katie Seipel on 9/9/14, re-analyze sample Ynl 1/Ynl 2 Composite (B14081625-001) for Thallium to achieve 0.0002 mg/L reporting limit.

The report has been revised and replaces any previously issued report in its entirety.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

October 08, 2014

Tintina Alaska Exploration Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B14091238      Quote ID: B2868 - Tintina Project  
Project Name: 3767 WK:88

Energy Laboratories Inc Billings MT received the following 1 sample for Tintina Alaska Exploration Inc on 9/12/2014 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B14091238-001	Ynl 1/Ynl 2 Composite	09/11/14 9:00	09/12/14	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

Digitally signed by

**Report Definitions:**  
 RL - Analyte reporting limit.  
 QCL - Quality control limit.  
 L - Lowest available reporting limit for the analytical method used.

MCL - Maximum contaminant level.  
 ND - Not detected at the reporting limit.

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

---

## Contact and Corrective Action Comments:

Sample Ynl 1/Ynl 2 Composite for Dissolved Phosphorus was received at pH ~ 6. 2 mL of sulfuric acid was added in the laboratory to preserve to pH<2. Sample was field filtered by the client.

Dear Lisa:

Enclosed is our report concerning results obtained from humidity cell (HC) kinetic acid rock drainage (ARD) potential tests conducted on composite and tailings samples from the Black Butte Copper project.

Our invoice for the completed work will be sent under separate cover.

Thank you for allowing us to serve you on the Black Butte project.

Sincerely,

Michael Medina  
Environmental Project Manager

**SUMMARY**

A tailings sample along with a total of 57 individual samples (to create four composites) were received for kinetic humidity cell testing. Kinetic humidity cell (D5744-13, Option A) tests were run on all samples and extracts were submitted to Energy Labs for detailed dissolved metals analysis. Modified ABA analysis was performed all humidity cell feed samples and on ended humidity cell tested residues. Size fraction screen analysis was performed on the Ynl B composite residue.

USZ Composite

Yc Composite

Non Saturated Tailings

Saturated Tailings

Ynl B Composite

LZFW Composite

## **SAMPLE PREPARATION AND FEED ANALYSIS**

### Composite Samples

A total of 57 individual samples were received to create four composites for testing. All samples were received at a -1/4" feed size. Appropriate samples were combined in entirety to create the samples for testing according to instructions provided by Enviromin, Inc. Sample make-up tables are included in Section 1 of the Appendix to this report. Samples for testing were individually blended and split (rotary splitter) to obtain 2.0 kg for humidity cell testing, 0.15 kg for mineralogy (Yc Composite and LZFW Composite samples only) and 0.30 kg for further crushing. Further crushing splits were pulverized to -150M and were blended and split (roll cloth) to obtain 0.20 kg for Mod ABA analysis. Splits for Mod ABA analysis were submitted to SVL Analytical. Mineralogy splits were shipped to the RJ Lee Group.

### Tailings Sample

The moist tailings sample was split to obtain 0.10 kg for moisture determination, two 1.75 kg (moist) splits for humidity cell testing and 0.15 kg for Mod ABA analysis. Splits for Mod ABA analysis were submitted to SVL Analytical.

Mod ABA static ARD potential tests were conducted on each sample to assess potential of the solids to generate or neutralize acid in a natural weathering and oxidizing environment.

### Samples with net neutralizing potential

Mod ABA results show that the Yc Composite, Ynl B Composite and LZFW Composite samples displayed a greater potential to neutralize than to generate acid in a natural environment. Results are summarized as follows:

- Paste pHs ranged from 7.7 to 8.0.
- Pyritic sulfide ranged from 0.15 to 1.75 wt. pct., and resulted in AGP values ranging from 4.7 to 54.7 tons CaCO<sub>3</sub> equivalents per 1,000 tons of solids.
- ANP values ranged from 36.7 to 180 CaCO<sub>3</sub>/1,000 tons.
- NNP values ranged from 5.6 to 160.0 CaCO<sub>3</sub>/1,000 tons.
- Ratios (ANP ÷ AGP) ranged from 1.10 to 9.00.

### Samples with net generating potential

Mod ABA results show that the USZ Composite and Tailings samples displayed a greater potential to generate than to neutralize acid in a natural environment. Results are summarized as follows:

- Paste pHs were 5.9 and 3.9 for the USZ Composite and Tailings samples, respectively.
- Pyritic sulfide contents were 22.80 and 17.70 wt. pct. and resulted in AGP values of 712.5 and 553.1 tons CaCO<sub>3</sub> equivalents per 1,000 tons of solids, respectively.
- ANP values were 128 and 19.8 CaCO<sub>3</sub>/1,000 tons, respectively.
- NNP values were -584.5 and -533.3 CaCO<sub>3</sub>/1,000 tons, respectively.
- Ratios (ANP ÷ AGP) were 0.18 and 0.04, respectively.

Mod ABA analysis results are provided in Table 1. The SVL report is provided in Section 2 of the Appendix to this report.

## HC KINETIC ARD POTENTIAL TEST PROCEDURE AND RESULTS

Modified HC kinetic ARD potential tests were conducted on 2.0017 kg, 2.0013 kg, 1.5369 kg, 2.0075 kg and 2.0154 kg splits of the USZ Composite, Yc Composite, Tailings (non saturated), Ynl B Composite and LZFW Composite samples (respectively) at the as received feed size (-1/4") to assess potential of the solids to generate or neutralize acid in an aggressive and accelerated weathering and oxidizing environment. The ASTM standard procedure (D5744-13, Option A) was employed the duration of the kinetic testing. A second tailings sample was evaluated using a modified procedure to simulate underwater storage of the tailings material. The modified saturated procedure is described below the standard humidity cell procedure. The testing duration (with week 0) was 75 weeks for the USZ Composite, 39 weeks for the Yc Composite, 48 weeks for the Tailings (non saturated and saturated) samples, 37 weeks for the Ynl B Composite and 56 weeks for the LZFW Composite.

### Standard Humidity Cell Procedure

The HC tests were conducted for 39+ weeks in seven day cycles. After initial saturation (week 0), dry, filtered compressed air was passed upwards through the solids charge the first three days of the cycle. Humidified air, generated by sparging filtered compressed air into deionized water (DI H<sub>2</sub>O, pH 5.5) contained in a temperature controlled (30° C) vessel, was passed upwards through the charge the next three days of the cycle. On the seventh day, the charge was saturated (flooded) with DI H<sub>2</sub>O and allowed to soak for one hour. For the tailings sample, 1.50 L was applied for week 0 and 0.75 L was applied for all subsequent weeks. For all other samples, 2.00 L was applied for week 0 and 1.00 L was applied for all subsequent weeks. After soaking, effluent was allowed to percolate through and drain freely from the solids charge. Effluent was collected in a sealed container and volume was measured by weighing. Unfiltered, unpreserved effluent samples were analyzed immediately for redox potential (Ag/AgCl reference), pH, EC, SO<sub>4</sub><sup>-</sup>, acidity and alkalinity. Separate effluent samples (50 mL) were filtered through a 0.45µm filter to produce extract. Those extracts were analyzed immediately for Fe<sub>T</sub>, Fe<sup>2+</sup> and Fe<sup>3+</sup> (by difference). Remaining weekly effluents were filtered (0.45µm), appropriately preserved and shipped to Energy Labs for the Montana suite of constituent analyses. Single-use,

disposable filters were used for all extracts. Weeks 0, 1, 2, 4, 8, 12, 16, 20 and every 4th week thereafter (including the final week of testing) extracts (not composites) were submitted for detailed metals analysis.

#### Saturated Humidity Cell Testing Procedures

The modified saturated HC test was conducted for 48 weeks in seven day cycles. After initial saturation (week 0), the sample charge was saturated (flooded) with DI H<sub>2</sub>O and allowed to soak for seven days. No air sparging cycles were used for this procedures. For the saturated tailings sample, 1.50 L was applied for week 0 and 0.75 L was applied for all subsequent weeks. After seven days, effluent was allowed to percolate through and drain freely from the solids charge. Effluent was collected in a sealed container and volume was measured by weighing. Unfiltered, unpreserved effluent samples were analyzed immediately for redox potential (Ag/AgCl reference), pH, EC, SO<sub>4</sub><sup>-</sup>, acidity and alkalinity. Separate effluent samples (50 mL) were filtered through a 0.45µm filter to produce extract. Those extracts were analyzed immediately for Fe<sub>t</sub>, Fe<sup>2+</sup> and Fe<sup>3+</sup> (by difference). Remaining weekly effluents were filtered (0.45µm), appropriately preserved and shipped to Energy Labs for the Montana suite of constituent analyses. Single-use, disposable filters were used for all extracts. Weeks 0, 1, 2, 4, 8, 12, 16, 20 and every 4th week thereafter extracts (not composites) were submitted for detailed metals analysis.

Weekly humidity cell test data are provided in Tables 2 through 7. The figures following each table depict graphically, on a weekly (a figure) and cumulative (b figure) mass basis, analytical data for pH, SO<sub>4</sub>, acidity and alkalinity. Constituent analysis results for selected weekly extracts are provided in Tables 8 through 13. Energy Labs report sheets for metals analyses on extracts are provided in the Section 3 of the Appendix to this report.

HC kinetic ARD potential test data demonstrate that the Yc Composite, Ynl B Composite and LZFW Composite samples would not generate acid in a natural weathering and oxidizing environment. Both saturated and non saturated tailings samples and the USZ Composite sample showed potential to generate acid. The nature of the tested samples is demonstrated by the data summary below.

**USZ Composite** (terminated after 73 weeks)

- Extract pH was fairly neutral and stable the majority of the test duration and steadily decreased after week 61. Extract pH ranged from pH 3.04 (week 73) to pH 6.94 (week 55).
- Redox potential was oxidizing and ranged from 133 (week 1) to 454 (week 70) mV.
- Conductivity values were moderate and fairly constant during the kinetic test, and ranged from 2010 (weeks 55 and 56) to 5360 (week 0)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was moderate and fairly stable through week 68 then increased steadily through the end of testing.
- Sulfate mobility was moderate. Week 0 extract concentration was 5100  $\text{mgSO}_4/\text{L}$ . Sulfate concentration decreased after week 0 and was fairly stable through week 62 then increased steadily through the end of testing. Only 7.88 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was detected in most weekly extracts and concentrations ranged from <1 (weeks 3, 23 and 46) to 1417 (week 0)  $\text{mgCaCO}_3$  equivalents/L. Maximum available acidity in the USZ Composite was 712,500  $\text{mg}/\text{kg}$ , but only 2,777.42  $\text{mgCaCO}_3/\text{kg}$  was consumed (0.39 percent of total) during the HCT.
- Alkalinity was detected in all weekly extracts after week 0 and concentrations ranged from <1 (multiple weeks) to 46 (week 3)  $\text{mgCaCO}_3$  equivalents/L. Maximum available alkalinity in the USZ Composite was 128,000  $\text{mg}/\text{kg}$ , but only 303.02  $\text{mgCaCO}_3/\text{kg}$  was consumed (0.24 percent of total) during the HCT.

**Yc Composite** (terminated after 38 weeks)

- Extract pH was basic (alkaline) and was fairly stable the majority of the test duration. Extract pH ranged from pH 7.34 (week 18) to pH 8.18 (week 4).
- Redox potential was oxidizing and ranged from 222 (week 0) to 386 (week 13) mV. This range of oxidizing potential is typical of solid/solution systems exposed to air, but was never at the oxidizing level (> 450 mV) to indicate oxidation of sulfide minerals.
- Conductivity values were low and fairly constant during the kinetic test, and ranged from 126 (week 38) to 450 (week 0)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was minimal and was <0.10  $\text{mg}/\text{L}$  for the majority of the testing weeks.
- Sulfate mobility was slight. Week 0 extract concentration was 130  $\text{mgSO}_4/\text{L}$ . Sulfate concentration decreased after week 0 and week 38 concentration was 21  $\text{mg}/\text{L}$ . Only 14.22% of the contained sulfate was mobilized during the kinetic test.
- Acidity was not detected in any weekly extract.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 33 (week 3) to 89 (week 0)  $\text{mgCaCO}_3$  equivalents/L. Maximum available alkalinity in the Yc composite was 260,000  $\text{mg}/\text{kg}$ , but only 904.38  $\text{mgCaCO}_3/\text{kg}$  was consumed (2.46 percent of total) during the HCT.

**Tailings Sample** (terminated after 47 weeks)

- Extract pH was acidic and fairly stable the duration of the HCT. Extract pH ranged from pH 6.26 (week 0) to pH 1.46 (week 32).
- Redox potential was oxidizing and ranged from 224 (week 40) to 448 (week 8) mV.
- Conductivity values were elevated and varied during the kinetic test, and ranged from 549 (week 35) to 27,900 (week 3)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was elevated and varied during the kinetic test.
- Sulfate mobility was elevated the duration of the test but did show a marked decrease after week 20. A total of 28.97 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was detected in all weekly extracts and concentrations ranged from 11 (week 0) to 29,131 (week 5)  $\text{mgCaCO}_3$  equivalents/L. Maximum available acidity in the Tailings sample was 553,100  $\text{mg}/\text{kg}$ , of which 108,120  $\text{mgCaCO}_3/\text{kg}$  was consumed (19.55 percent of total) during the HCT.
- Alkalinity was not detected in any weekly extract after week 0.

**Saturated Tailings Sample** (terminated after 47 weeks)

- Extract pH was acidic and fairly stable the duration of the HCT. Extract pH ranged from pH 6.26 (week 0) to pH 1.46 (week 32).
- Redox potential was oxidizing and ranged from 75 (week 1) to 456 (week 42) mV.
- Conductivity values were moderate and ranged from 1,992 (week 1) to 192 (week 15)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was moderate and increased after week 28 as pH decreased.
- Sulfate mobility was moderate. Week 0 extract concentration was 1,100  $\text{mgSO}_4/\text{L}$  and concentrations decreased after week 2. Only 0.90 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was detected in most weekly extracts and concentrations ranged from  $<1$  (multiple weeks) to 111 (week 37)  $\text{mgCaCO}_3$  equivalents/L. Maximum available acidity in the Saturated Tailings sample was 553,100  $\text{mg}/\text{kg}$ , of which 514.70  $\text{mgCaCO}_3/\text{kg}$  was consumed (0.09 percent of total) during the HCT.
- Alkalinity was detected in most weekly extracts and concentrations ranged from  $<1$  (multiple weeks) to 26 (weeks 12 and 14)  $\text{mgCaCO}_3$  equivalents/L. Maximum available alkalinity in the Saturated Tailings sample was 19,800  $\text{mg}/\text{kg}$ , of which 234.48  $\text{mgCaCO}_3/\text{kg}$  was consumed (1.18 percent of total) during the HCT.

**Ynl B Composite** (terminated after 36 weeks)

- Extract pH was basic (alkaline) and was fairly stable the duration of the HCT. Extract pH ranged from pH 7.16 (week 33) to pH 7.86 (week 3).
- Redox potential was oxidizing and ranged from 107 (week 31) to 382 (week 35) mV. This range of oxidizing potential is typical of solid/solution systems exposed to air, but was never at the oxidizing level ( $> 450$  mV) to indicate oxidation of sulfide minerals.
- Conductivity values were low and fairly constant during the kinetic test, and ranged from 279 (week 32) to 1723 (week 7)  $\mu\text{S}/\text{cm}$ .
- Iron mobility (dissolution) was minimal and was  $<0.10$   $\text{mg}/\text{L}$  for the majority of the testing weeks.

- Sulfate mobility was moderate. Week 0 extract concentration was 650 mgSO<sub>4</sub>/L. Sulfate concentration gradually decreased after week 6 and week 36 concentration was 110 mg/L. A total of 21.56 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was only detected in 2 weekly extracts.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 18 (week 6) to 90 (week 0) mgCaCO<sub>3</sub> equivalents/L. Maximum available alkalinity in the Ynl 0 sample was 180,000 mg/kg, but only 520.85 mgCaCO<sub>3</sub>/kg was consumed (0.29 percent of total) during the HCT.

**LZFW Composite** (terminated after 56 weeks)

- Extract pH was basic (alkaline) and was fairly stable the duration of the HCT. Extract pH ranged from pH 7.00 (week 33) to pH 7.83 (week 54).
- Redox potential was oxidizing and ranged from 197 (week 31) to 393 (week 12) mV. This range of oxidizing potential is typical of solid/solution systems exposed to air, but was never at the oxidizing level (> 450 mV) to indicate oxidation of sulfide minerals.
- Conductivity values were low and fairly constant during the kinetic test, and ranged from 184 (week 54) to 1,094 (week 0) μS/cm.
- Iron mobility (dissolution) was minimal and was <0.10 mg/L for the majority of the testing weeks.
- Sulfate mobility was low. Week 0 extract concentration was 450 mgSO<sub>4</sub>/L. Sulfate concentration gradually decreased after week 1 and week 56 concentration was 68 mg/L. Only 4.77 percent of the contained sulfate was mobilized during the kinetic test.
- Acidity was only detected in 2 weekly extracts.
- Alkalinity was detected in all weekly extracts and concentrations ranged from 9 (week 52) to 61 (week 0) mgCaCO<sub>3</sub> equivalents/L. Maximum available alkalinity in the LZFW Composite sample was 60,300 mg/kg, but only 667.52 mgCaCO<sub>3</sub>/kg was consumed (1.11 percent of total) during the HCT.

Table 14 provides maximum available acidity, sulfate and alkalinity, on a mass basis, and those component dissolutions (mass basis) during the HC kinetic ARD potential test. Maximum availability data obtained from Mod ABA static ARD potential testing data.

**Table 14. - Comparative Static and Kinetic Test Acidity, Sulfate and Alkalinity Generation Data, Black Butte Composites and Tailings Samples**

Sample I.D.	Acidity, mg/kg			Sulfate, mg/kg			Alkalinity, mg/kg		
	Max. from Solids <sup>1)</sup>	Generated		Max. from Solids <sup>2)</sup>	Generated		Max. from Solids <sup>3)</sup>	Generated	
		HC Test	Pct. of Total		HC Test	Pct. of Total		HC Test	Pct. of Total
USZ Composite	712,500	2,777.42	0.39	876,000	68,994.20	7.88	128,000	303.02	0.24
Yc Composite	4,700	0.00	0.00	5,400	767.81	14.22	36,700	904.38	2.46
Non Saturated Tailings	553,100	108,120.02	19.55	786,000	227,675.20	28.97	19,800	9.26	0.05
Saturated Tailings	553,100	514.70	0.09	786,000	7,078.80	0.90	19,800	234.48	1.18
Ynl B Composite	20,000	5.38	0.03	22,800	4,916.47	21.56	180,000	520.85	0.29
LZFW Composite	54,700	5.87	0.01	60,300	2,876.65	4.77	60,300	667.52	1.11

1) AGP (tons CaCO<sub>3</sub>/1,000 tons) x 1,000.  
 2) Total S as SO<sub>4</sub><sup>-2</sup> converted from weight percent to mg/kg.  
 3) ANP (tons CaCO<sub>3</sub>/1,000 tons) x 1,000.

Mass data demonstrate that, for all samples other than the Non Saturated Tailings sample and sulfate on the Yc Composite and Ynl B Composite samples, small percentages of acidity, sulfate and alkalinity contained in the feeds were generated during the HC tests.

Extract analysis results show that constituent (metals) mobility was minimal during the kinetic HCT for the USZ Composite, Yc Composite, Saturated Tailings, Ynl B Composite and LZFW Composite samples. Metals mobility was elevated for the Non Saturated Tailings sample.

## **RESIDUE ANALYSIS**

After testing all samples had splits taken from the humidity cell residue for Mod ABA analysis. The USZ, Ynl B and LZFW composite samples had splits taken for ICP metals and size fraction screen analysis (1.0 kg). Splits for Mod ABA analysis were submitted to SVL Analytical, Inc. Splits for ICP analysis were submitted to ALS.

Mod ABA results show that the Yc Composite and Ynl B Composite samples displayed a greater potential to neutralize than to generate acid in a natural environment. Results are summarized as follows:

- Paste pHs were 8.0 and 7.8 for the Yc Composite and Ynl B Composite samples, respectively.
- Pyritic sulfide contents were 0.13 and 0.45 wt. pct. and resulted in AGP values of 4.1 and 14.1 tons CaCO<sub>3</sub> equivalents per 1,000 tons of solids, respectively.
- ANP values were 13.0 and 147 CaCO<sub>3</sub>/1,000 tons, respectively.
- NNP values were 8.9 and 132.9 CaCO<sub>3</sub>/1,000 tons, respectively.
- Ratios (ANP ÷ AGP) were 3.17 and 10.43, respectively.

Mod ABA results show that the USZ Composite, Non Saturated Tailings, Saturated Tailings and LZFW Composite samples displayed a greater potential to generate than to neutralize acid in a natural environment. Results are summarized as follows:

- Paste pHs ranged from 2.2 to 7.7.
- Pyritic sulfide ranged from 1.42 to 19.70 wt. pct., and resulted in AGP values ranging from 44.4 to 615.6 tons CaCO<sub>3</sub> equivalents per 1,000 tons of solids.
- ANP values ranged from <0.3 to 40.5 CaCO<sub>3</sub>/1,000 tons.
- NNP values ranged from -4.4 to -595.9 CaCO<sub>3</sub>/1,000 tons.
- Ratios (ANP ÷ AGP) ranged from <0.01 to 0.90.

Mod ABA analysis results are provided in Table 15. ICP results are provided in Table 16. Size fraction screen analysis results are provided in Tables 17, 18 and 19. The SVL Analytical report for ABA analysis and the ALS report for ICP metals are provided in Section 2 of the Appendix to this report.

## CONCLUSIONS

- The Yc Composite, Ynl B Composite and LZFW Composite samples would not produce acid in a natural weathering and oxidizing environment as predicted by the static ABA data.
- The USZ Composite, Non Saturated Tailings and Saturated Tailings samples showed potential to produce acid as predicted by the static ABA data. Metals mobility was considerably elevated for the Non Saturated Tailings sample.

### Notes and Definitions

- A2        2 g of sample used in ANP analysis
  - A5        5 g of sample used in ANP analysis
  - D2        Sample required dilution due to high concentration of target analyte.
  - R2B       RPD exceeded the laboratory acceptance limit.
  - LCS       Laboratory Control Sample (Blank Spike)
  - RPD       Relative Percent Difference
  - UDL       A result is less than the detection limit
  - R > 4S    % recovery not applicable, sample concentration more than four times greater than spike level
  - <RL       A result is less than the reporting limit
  - MRL       Method Reporting Limit
  - MDL       Method Detection Limit
  - N/A       Not Applicable

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

**Notes and Definitions**

- A2 2 g of sample used in ANP analysis
- A5 5 g of sample used in ANP analysis
- B7 Target analyte detected in method blank exceeded method QC limits, but concentrations in the samples are at least 10x the blank concentration.
- D2 Sample required dilution due to high concentration of target analyte.
- LCS Laboratory Control Sample (Blank Spike)
- RPD Relative Percent Difference
- UDL A result is less than the detection limit
- R > 4S % recovery not applicable, sample concentration more than four times greater than spike level
- <RL A result is less than the reporting limit
- MRL Method Reporting Limit
- MDL Method Detection Limit
- N/A Not Applicable

**ANALYTICAL REPORT FOR SAMPLES**

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received	Notes
SATURATED TAILINGS (HC-4)	W6F0042-01	Soil	31-May-16 11:00	02-Jun-2016	
NON-SATURATED TAILINGS (HC-3)	W6F0042-02	Soil	31-May-16 11:00	02-Jun-2016	

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

### Notes and Definitions

- A5        5 g of sample used in ANP analysis
  - D2        Sample required dilution due to high concentration of target analyte.
  - LCS       Laboratory Control Sample (Blank Spike)
  - RPD       Relative Percent Difference
  - UDL       A result is less than the detection limit
  - R > 4S   % recovery not applicable, sample concentration more than four times greater than spike level
  - <RL       A result is less than the reporting limit
  - MRL       Method Reporting Limit
  - MDL       Method Detection Limit
  - N/A       Not Applicable

**Notes and Definitions**

- A5 5 g of sample used in ANP analysis
- D2 Sample required dilution due to high concentration of target analyte.
- LCS Laboratory Control Sample (Blank Spike)
- RPD Relative Percent Difference
- UDL A result is less than the detection limit
- R > 4S % recovery not applicable, sample concentration more than four times greater than spike level
- <RL A result is less than the reporting limit
- MRL Method Reporting Limit
- MDL Method Detection Limit
- N/A Not Applicable

**CERTIFICATE RE16149263**

Project: 3767- 01

This report is for 4 Pulp samples submitted to our lab in Reno, NV, USA on 6-SEP-2016.

The following have access to data associated with this certificate:

CHRISTINE DEBURLE  
 JACK MCPARTLAND

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
PUL- 21	Pulverize entire sample
LOG- 24	Pulp Login - Rcd w/o Barcode

ANALYTICAL PROCEDURES	
ALS CODE	DESCRIPTION
ME- MS61	48 element four acid ICP- MS
Hg- MS42	Trace Hg by ICPMS

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geological materials collected by the prospective investor or by a qualified person selected by him/her and based on an evaluation of all engineering data which is available concerning any proposed project. Statement required by Nevada State Law NRS 519

To: MCCLELLAND LABS  
 ATTN: JACK MCPARTLAND  
 1016 GREG ST  
 SPARKS NV 89431

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

# ANALYTICAL SUMMARY REPORT

June 26, 2015

Tintina Montana Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B15061624      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:0

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Montana Inc on 6/17/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15061624-001	USZ Comp	06/16/15 9:00	06/17/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15061624-002	Yc Comp	06/16/15 9:00	06/17/15	Aqueous	Same As Above
B15061624-003	Tailings	06/16/15 9:00	06/17/15	Aqueous	Same As Above
B15061624-004	Tailings (Saturated)	06/16/15 9:00	06/17/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

- Water - pH acceptable upon receipt? Yes  No  Not Applicable

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

Sample date and time for LZ FW Comp was taken from the sample containers.

**Report Date:** 07/07/15

## CASE NARRATIVE

---

Revised 7/14/2015:

Upon further data review it was discovered that the original Thallium result for sample Tailings (B15062256-003) was reported in error. The value has been changed from 2.34 mg/L to 0.326 mg/L. We apologize for any inconvenience this may have caused.

The report has been revised and replaces any previously issued report in its entirety.

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

July 13, 2015

Tintina Montana Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B15070131      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:2

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Montana Inc on 7/1/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15070131-001	USZ Comp	06/30/15 9:00	07/01/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15070131-002	Yc Comp	06/30/15 9:00	07/01/15	Aqueous	Same As Above
B15070131-003	Tailings	06/30/15 9:00	07/01/15	Aqueous	Same As Above
B15070131-004	Tailings (Saturated)	06/30/15 9:00	07/01/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

Digitally signed by  
Keri Center  
Date: 2015.07.14 14:35:22 -06:00

**CLIENT:** Tintina Montana Inc  
**Project:** 3767-01 WK:2  
**Work Order:** B15070131

**Report Date:** 07/13/15

## **CASE NARRATIVE**

---

Revised 7/14/2015;

The client sample ID did not match the COC on the original report sent for sample Tailings (B15070131-003). The sample ID has been corrected. We apologize for any inconvenience this may have caused.

The report has been revised and replaces any previously issued report in its entirety.

- Water - pH acceptable upon receipt? Yes  No  Not Applicable

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

In certain circumstances, samples submitted to Energy Laboratories, Inc. may be subcontracted to other certified laboratories in order to complete the analysis requested. This serves as notice of this possibility. All sub-contract data will be clearly notated on your analytical report. Visit our web site at [www.energylab.com](http://www.energylab.com) for additional information, downloadable fee schedule, forms, and links.

**Table 2. Trace element parameters recommended by DEQ for leachate analysis following proposed humidity cell testing, Tintina project**

Parameter	Required Reporting Value (mg/L)
Aluminum	0.009
Antimony	0.0005
Arsenic	0.001
Barium	0.003
Beryllium	0.0008
Cadmium	0.00003

# ANALYTICAL SUMMARY REPORT

July 15, 2015

Tintina Montana Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B15070696                      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:1

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Montana Inc on 7/8/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15070696-001	Ynl B Comp	07/07/15 9:00	07/08/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15070696-002	LZ FW Comp	07/07/15 9:00	07/08/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

The sample date and time for LZ FW Comp was taken from the sample containers.

**Report Definitions:**  
RL - Analyte reporting limit.  
QCL - Quality control limit.  
D - RL increased due to sample matrix.

MCL - Maximum contaminant level.  
ND - Not detected at the reporting limit.  
L - Lowest available reporting limit for the analytical method used.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

In certain circumstances, samples submitted to Energy Laboratories, Inc. may be subcontracted to other certified laboratories in order to complete the analysis requested. This serves as notice of this possibility. All sub-contract data will be clearly notated on your analytical report. Visit our web site at [www.energylab.com](http://www.energylab.com) for additional information, downloadable fee schedule, forms, and links.

# ANALYTICAL SUMMARY REPORT

July 28, 2015

Tintina Montana Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B15071408                      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:2

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Montana Inc on 7/15/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15071408-001	Ynl B Comp	07/14/15 9:00	07/15/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15071408-002	LZ FW Comp	07/14/15 9:00	07/15/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

Sample date and time for LZ FW Comp was taken from the sample containers.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

Unpreserved container for sample Ynl B Comp received broken. Per phone call with Mike Medina, cancel analysis and client will resample.

LABORATORY USE ONLY

In certain circumstances, samples submitted to Energy Laboratories, Inc. may be subcontracted to other certified laboratories in order to complete the analysis requested. This serves as notice of this possibility. All sub-contract data will be clearly notated on your analytical report. Visit our web site at [www.energylab.com](http://www.energylab.com) for additional information, downloadable fee schedule, forms, and links.

**Table 2. Trace element parameters recommended by DEQ for leachate analysis following proposed humidity cell testing, Tintina project**

Parameter	Required Reporting Value (mg/L)
Aluminum	0.009
Antimony	0.0005
Arsenic	0.001
Barium	0.003
Beryllium	0.0008
Cadmium	0.00003
Calcium	1.0
Chromium	0.01
Copper	0.002
Fluoride	0.2
Iron	0.02
Lead	0.0003
Magnesium	1.0
Manganese	0.005
Mercury	0.000005
Nickel	0.002
Phosphorus	0.001
Selenium	0.001
Silver	0.0002
Strontium	0.02
Sulfate	1.0
Thallium	0.0002
Uranium	0.0002
Zinc	0.008

Based on MT DEQ7 revised 10/2012

# ANALYTICAL SUMMARY REPORT

August 24, 2015

Tintina Montana Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B15081032      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:8

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Montana Inc on 8/12/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15081032-001	USZ Comp	08/11/15 9:00	08/12/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15081032-002	Yc Comp	08/11/15 9:00	08/12/15	Aqueous	Same As Above
B15081032-003	Tailings	08/11/15 9:00	08/12/15	Aqueous	Same As Above
B15081032-004	Tailigs (Saturated)	08/11/15 9:00	08/12/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

### Qualifiers:

RL - Analyte reporting limit.

A - The analyte level was greater than four times the spike level. In accordance with the method % recovery is not calculated.

ND - Not detected at the reporting limit.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

September 04, 2015

Tintina Montana Inc  
Ste 2560 - 200 Granville St  
Vancouver, BC V6C 1S4

Work Order: B15082343      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:8

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Montana Inc on 8/26/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15082343-001	Ynl B Comp	08/25/15 9:00	08/26/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15082343-002	LZ FW Comp	08/25/15 9:00	08/26/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

- Water - pH acceptable upon receipt? Yes  No  Not Applicable

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

LABORATORY USE ONLY

In certain circumstances, samples submitted to Energy Laboratories, Inc. may be subcontracted to other certified laboratories in order to complete the analysis requested. This serves as notice of this possibility. All sub-contract data will be clearly notated on your analytical report. Visit our web site at [www.energylab.com](http://www.energylab.com) for additional information, downloadable fee schedule, forms, and links.

**Table 2. Trace element parameters recommended by DEQ for leachate analysis following proposed humidity cell testing, Tintina project**

Parameter	Required Reporting Value (mg/L)
Aluminum	0.009
Antimony	0.0005
Arsenic	0.001
Barium	0.003
Beryllium	0.0008
Cadmium	0.00003

Zinc	0.008

Based on MT DEQ7 revised 10/2012

# ANALYTICAL SUMMARY REPORT

September 17, 2015

Tintina Montana Inc  
PO Box 48736 Bentall  
Vancouver, BC V7X 1A6

Work Order: B15090811      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:12

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Montana Inc on 9/9/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15090811-001	USZ Comp	09/08/15 9:00	09/09/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15090811-002	Yc Comp	09/08/15 9:00	09/09/15	Aqueous	Same As Above
B15090811-003	Tailings	09/08/15 9:00	09/09/15	Aqueous	Same As Above
B15090811-004	Tailings (Saturated)	09/08/15 9:00	09/09/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

- Sufficient sample volume for indicated test? Yes  No
- All samples received within holding time?  
(Exclude analyses that are considered field parameters such as pH, DO, Res Cl, Sulfite, Ferrous Iron, etc.) Yes  No
- Temp Blank received in all shipping container(s)/cooler(s)? Yes  No  Not Applicable
- Container/Temp Blank temperature: 3.7°C On Ice
- Water - VOA vials have zero headspace? Yes  No  No VOA vials submitted
- Water - pH acceptable upon receipt? Yes  No  Not Applicable

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

---

## Contact and Corrective Action Comments:

The sulfuric preserved bottle for sample for YNL B Comp was received cracked and compromised. Per phone conversation with Mike Medina subsample and preserve the filtered raw sample with sulfuric acid.

# ANALYTICAL SUMMARY REPORT

October 19, 2015

Tintina Montana Inc  
PO Box 48736 Bentall  
Vancouver, BC V7X 1A6

Work Order: B15100767      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:16

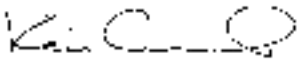

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Montana Inc on 10/8/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15100767-001	USZ Comp	10/06/15 9:00	10/08/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15100767-002	Yc Comp	10/06/15 9:00	10/08/15	Aqueous	Same As Above
B15100767-003	Tailings	10/06/15 9:00	10/08/15	Aqueous	Same As Above
B15100767-004	Tailings (Saturated)	10/06/15 9:00	10/08/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:   
Supervisor, Wet Chemistry

- Samples in proper container/bottle? Yes  No
- Sample containers intact? Yes  No
- Sufficient sample volume for indicated test? Yes  No
- All samples received within holding time?  
(Exclude analyses that are considered field parameters such as pH, DO, Res Cl, Sulfite, Ferrous Iron, etc.) Yes  No
- Temp Blank received in all shipping container(s)/cooler(s)? Yes  No  Not Applicable
- Container/Temp Blank temperature: 6.0°C On Ice
- Water - VOA vials have zero headspace? Yes  No  Not Applicable
- Water - pH acceptable upon receipt? Yes  No  Not Applicable

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

# ANALYTICAL SUMMARY REPORT

October 29, 2015

Tintina Montana Inc  
PO Box 48736 Bentall  
Vancouver, BC V7X 1A6

Work Order: B15101741      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:16

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Montana Inc on 10/21/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15101741-001	Ynl B Comp	10/20/15 9:00	10/21/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15101741-002	LZ FW Comp	10/20/15 9:00	10/21/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

Report Approved By:

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

LA FW Comp sample date and time were taken from the sample containers.

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

**Custody Record MUST be Signed**

In certain circumstances, samples submitted to Energy Laboratories, Inc. may be subcontracted to other certified laboratories in order to complete the analysis requested. This serves as notice of this possibility. All sub-contract data will be clearly noted on your analytical report. Visit our web site at [www.energylab.com](http://www.energylab.com) for additional information, downloadable fee schedule, forms, and links.

**Table 2. Trace element parameters recommended by DEQ for leachate analysis following proposed humidity cell testing, Tintina project**

Parameter	Required Reporting Value (mg/L)
Aluminum	0.009
Antimony	0.0005
Arsenic	0.001

# ANALYTICAL SUMMARY REPORT

November 25, 2015

Tintina Montana Inc  
PO Box 48736 Bentall  
Vancouver, BC V7X 1A6

Work Order: B15111472                      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:20

Energy Laboratories Inc Billings MT received the following 2 samples for Tintina Montana Inc on 11/18/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15111472-001	Ynl B Comp	11/17/15 9:00	11/18/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15111472-002	LZ FW Comp	11/17/15 9:00	11/18/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

---

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

---

# ANALYTICAL SUMMARY REPORT

December 10, 2015

Tintina Montana Inc  
PO Box 48736 Bentall  
Vancouver, BC V7X 1A6

Work Order: B15120211      Quote ID: B2868 - Tintina Project  
Project Name: 3767-01 WK:24

Energy Laboratories Inc Billings MT received the following 4 samples for Tintina Montana Inc on 12/2/2015 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B15120211-001	USZ Comp	12/01/15 9:00	12/02/15	Aqueous	Metals by ICP/ICPMS, Dissolved Mercury, Dissolved Fluoride Anions by Ion Chromatography Digestion, Mercury by CVAA Digestion, Total P Phosphorus, Total Dissolved
B15120211-002	Yc Comp	12/01/15 9:00	12/02/15	Aqueous	Same As Above
B15120211-003	Tailings	12/01/15 9:00	12/02/15	Aqueous	Same As Above
B15120211-004	Tailings (Saturated)	12/01/15 9:00	12/02/15	Aqueous	Same As Above

The analyses presented in this report were performed by Energy Laboratories, Inc., 1120 S 27th St., Billings, MT 59101, unless otherwise noted. Any exceptions or problems with the analyses are noted in the Laboratory Analytical Report, the QA/QC Summary Report, or the Case Narrative.

The results as reported relate only to the item(s) submitted for testing.

If you have any questions regarding these test results, please call.

- Chain of custody present? Yes  No
- Chain of custody signed when relinquished and received? Yes  No
- Chain of custody agrees with sample labels? Yes  No
- Samples in proper container/bottle? Yes  No
- Sample containers intact? Yes  No
- Sufficient sample volume for indicated test? Yes  No
- All samples received within holding time?  
(Exclude analyses that are considered field parameters such as pH, DO, Res Cl, Sulfite, Ferrous Iron, etc.) Yes  No
- Temp Blank received in all shipping container(s)/cooler(s)? Yes  No  Not Applicable
- Container/Temp Blank temperature: 7.2°C On Ice
- Water - VOA vials have zero headspace? Yes  No  Not Applicable
- Water - pH acceptable upon receipt? Yes  No  Not Applicable

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

## Contact and Corrective Action Comments:

None

**Report Definitions:**  
 RL - Analyte reporting limit.  
 QCL - Quality control limit.  
 L - Lowest available reporting limit for the analytical method used.

MCL - Maximum contaminant level.  
 ND - Not detected at the reporting limit.
