## **CERTIFICATION OF DATA INTEGRITY**

Bison Engineering, Inc., certifies the data in this report is an accurate summary of the air quality conditions measured at the Black Butte Copper Project air monitoring site. Every effort was made to obtain accurate and representative data and to comply with the procedures set forth in the project-specific *Quality Assurance Project Plan*, the *State of Montana Ambient Air Monitoring Program Quality Assurance Project Plan* (April 2013), and the Environmental Protection Agency's *Quality Assurance Handbook for Air Pollution Measurement Systems: Volume I, A Field Guide to Environmental Quality Assurance* (April 1994), *Volume II, Ambient Air Quality Program* (May 2013), and *Volume IV, Meteorological Measurements* (March 2008).

## **1.0 INTRODUCTION**

---

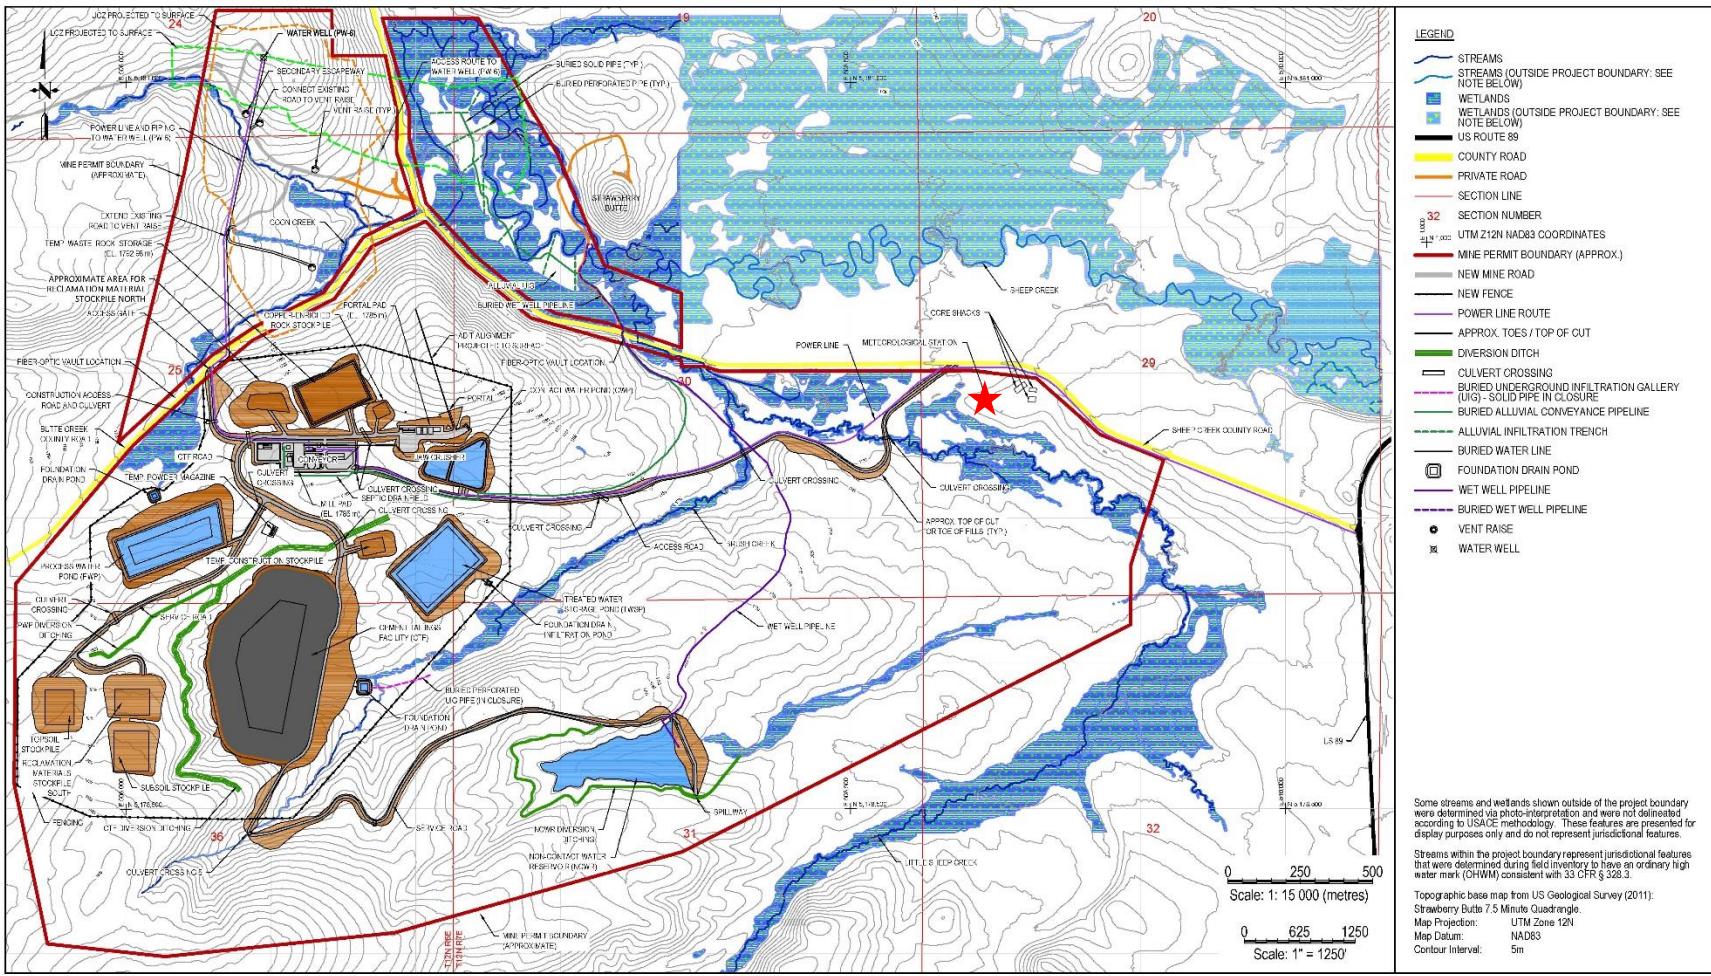

Sandfire Resources, Inc. established an ambient air monitoring site to measure wind speed, wind direction, standard deviation of wind direction, temperature at 9 meters and 2 meters, delta temperature, solar radiation, barometric pressure, and precipitation. The station was established to accurately characterize the local meteorology and collect baseline data in support of an operating permit application and various environmental studies.

The meteorological monitoring system was installed in April 2012. The site is operated by Bison Engineering, Inc., of Helena and Billings. Figure 1 shows the current location of the monitoring site, depicted by a red star. It is located to the west-southwest of the core shed buildings. On February 6, 2018 the tower was shut down and moved to a new location approximately 300 feet southwest of the original location, where monitoring resumed on March 7, 2018. Relocation activities were documented in the monitoring report for the first quarter of 2018.

This report presents the data collected during the first quarter (January through March) of 2020. In addition, a description of the monitoring system operations is presented, together with summaries of quality assurance activities, including calibrations and performance audits. Tabular summaries of the data completeness achieved, and the periods of missing data also are presented. Appendix A presents hourly meteorological data collected.

On June 23, 2015, an evaporation pan and manual precipitation gauge were installed adjacent to the existing meteorological system. The evaporation data will be used for hydrological / water balance studies. The manual rain gauge was installed to provide a backup data source for the existing automatic rain gauge, which has experienced occasional mechanical problems. Also, the automatic rain gauge is sometimes unreliable for measuring frozen precipitation. Neither the evaporation pan nor the manual rain gauge was operated during the first quarter of 2020.

## **2.0 MONITORING SYSTEM OPERATIONS**

---

Monitoring activities continued in the normal manner during the first quarter of 2020. Data were downloaded and reviewed by Bison at least once a week and examined for suspect behavior. All instruments except the automatic rain gauge were operational throughout the quarter. Other than the rain gauge problems (described below), data losses were limited to seven hours of wind speed data in March when the anemometer cups were frozen in place by snow and ice.

Review of hourly data records indicated that the rain gauge heater failed around the start of 2020. Failure of the gauge heater was subsequently confirmed by Sandfire personnel. Because virtually all precipitation at the Black Butte site falls as snow from January through March, failure of the heater renders any precipitation readings during those months questionable since they only reflect periods when ambient temperatures were sufficiently warm to melt some of the snow accumulated in the rain gauge funnel. The readings do not accurately reflect hourly precipitation.

A replacement rain gauge heater was obtained from Met One in February with the intention of installing it during the Quarter 1 performance audit. The audit was initially delayed by excessive snow cover. Once the snow cover had decreased in late March the site was shut down due to Covid-19 virus concerns. In late May, the restrictions were eased to permit as-needed activities at the Black Butte site. An audit was performed on June 2, and all results were satisfactory. The replacement heater will be installed during the Quarter 3 audit, which will occur in August or early September.

## **3.0 PERFORMANCE AUDIT DATA**

---

The performance audit originally contemplated for the first quarter of 2020 was delayed due to Covid-19 restrictions. The audit was performed on June 2, after restrictions were eased to permit site access for essential activities. All audit results were satisfactory, including the rain gauge. As discussed in Section 2.0, the rain gauge heater failed during the past winter which rendered the precipitation data unreliable. However, the June 2 audit showed the tipping bucket mechanism itself to be working correctly.

The preceding audit was performed on December 5, 2019. Because both the December 5 and June 2 audit results were satisfactory, all meteorological instruments – except for the rain gauge – are believed to have functioned properly throughout the first quarter.

## **4.0 CALIBRATION DATA**

---

The performance audit discussed in Section 3.0 showed all meteorological sensors to be working correctly and no calibration adjustments were made. A replacement rain gauge heater was obtained in February with the intention installing it at the site during the Quarter 1 audit. Because the audit was delayed until June 2, the decision was made to wait until the Quarter 3 audit (in August or early September 2020) to install it, and avoid subjecting the heater to unnecessary wear – since virtually all precipitation from June through early September would be expected to fall as rain.

## 5.0 DATA COMPLETENESS

---

The meteorological percentages of data recovery achieved during the first quarter of 2020 are given in Tables 1 and 2. In these tables, the number of possible data values during each month of the quarter is given, together with the number of valid readings and the number of hours spent on quality assurance activities (such as calibrations, performance audits, and maintenance on the sensors). The quality assurance hours are added to the number of hours of valid data to compute the net percentage data recovery.

During the first quarter the net percentage data recovery was 99.6 percent for wind speed, and 100.0 percent for all other parameters except precipitation. The loss of wind speed data was due to the anemometer cups being briefly frozen in place by snow and ice. No valid precipitation data were collected due to a frozen gauge heater, as discussed in Section 2.0.

## **6.0 MONITORING DATA**

---

The hourly data values collected at the monitoring site are given in the data tables in Appendix A. Each of these tables presents one month's data for one parameter in the monitoring system. In addition, the average, maximum, and minimum values for each parameter for each day are listed (for wind direction, the prevailing wind direction for the day is given). For those hours with missing data, a code is given that explains the reason the data were missing. These codes are given in Table 3.

Monthly and quarterly wind rose distributions from the monitoring site are presented in Tables 4 through 7. These tables give the percentage frequency of occurrence of winds from 16 cardinal directions and from 22 wind speed ranges. These same data are presented graphically in Figures 2 through 5. In the wind rose figures, the length of each "petal" of the rose is proportional to the percentage of time the wind blew from that direction. On the bottom of each figure is a histogram showing the average wind speed from each of the cardinal wind directions.

## **APPENDIX B: PERFORMANCE AUDIT REPORT**

### **FIRST QUARTER 2020**

---

**Audit delayed until June 2, 2020 due to Covid-19 restrictions**

### Bison Engineering

#### Preliminary Meteorological Parameters Audit Form

Audit Dates: 06/02/2020 Tower Lowered : 11:30 MST Tower Back Up : 15:30 MST  
 Client: Tintina Resources  
 Site: Black Butte  
 AUDITOR: Don Milmine PRECEDING CALIBRATION BY: Jeff Bell

#### Temperature

Audit Device: Control Company - digital thermometer Model 4000  
 Meter S/N: 140251289 Temperature Sensor: Climatronics 100093  
 Last certified: 6/4/2019 S/N X17929 (Upper), S/N X17927 (Lower) - Matched Set

### Precipitation

Rain Gauge = Met One Model 375D, Serial No. N3939  
This gauge installed as temporary replacement for site gauge which had failed. Gauge had no heater.  
Level checked OK  
Wind Screen in place  
8" opening  
Precip audit performed June 2, 2020  
250 ml water added  
Calibration is 8.24 ml per tip  
Known audit value is 250 / 8.24 = 30.3 tips (so 30 full tips expected)  
Unit registered 30 tips  
% difference from expected = 0.0%
